# WD CAVIAR ENHANCED IDE DRIVES

The best quality and reliability in the industry – available from Supercom

## Why you should be buying WD from Supercom

Western Digital is an innovation leader in the hard drive field that provides exceptional performance, quality and unsurpassed reliability in its WD Caviar hard drives. The WD Caviar 3.5-inch hard drives provide the performance, quality, and reliability required by today's high-performance Pentium, Pentium Pro and Power PC computers. These drives offer a full complement of features in a wide range of drive capacities, up to 4.0 GB, making the WD Caviar series powerful drive solutions for any need.

CacheFlow, CacheRow, Reed-Solomon 17-bit on-the-fly ECC, advanced defect management, guaranteed compatibility, universal translation, increased reliability, and advanced power management are but a few of the features that underscore the exceptional design of WD Caviar hard drives. The Enhanced IDE features on all Caviar drives support local bus IDE applications for the fastest data transfers. When integrated into PCI local bus environments, the performance levels of these drives are even higher.

Advanced design, extensive testing, and state-of-the-art manufacturing yield highly reliable hard drive products. This award-winning combination and our commitment to quality allowed Western Digital to offer the industry's first three-year warranty on its WD Caviar IDE hard drives. The WD Caviar hard drives are fully certified to run Novell, Microsoft Windows 95, and Microsoft Windows NT 4.0 applications.

The entire family of Western Digital IDE and Enterprise SCSI hard drives are available from Supercom, your source for quality computer systems, peripherals and components. Supercom's commitment to excellence delivers the products, pricing, service and support you need to help you keep your competitive edge.

## with the new Champion series hard drives.

### CHAMPION SERIES

**C2000-2AF 2.0 GB**  
**C2500-3AF 2.5 GB**  
**C3000-3AF 3.0 GB**

- High performance and capacity
- Up to 256 KB cache buffer
- 5400 RPM
- <12 ms access time
- Enhanced IDE Fast ATA-3 interface
- 16.6 MB/sec transfer rates
- 3-year warranty
- Designed for Windows 95
- Encapsulated PCBs for superior quality and reliability
- Rugged and reliable-500,000 hour MTBF

**JTS**  
Driving The Future™

The JTS 3.5-inch Champion series hard disk drives provide mainstream storage for entry-level to performance desktop computers. These rugged and reliable drives satisfy a broad spectrum of demanding data storage applications.

## The Wisdom Of Golf?

"Don't worry about trying to hit the ball — it's just something that gets carried along in the process of your swing."

That's what my golf instructor has just told me, after my second lesson at that peculiar spot. When I totally miss the tiny white sphere, it's "Oh no, that's okay — it's your posture and your swing that are most important." And when the evil little golf gives a painful little lourough and comes to rest a few feet in front of me, he cheerfully points out: "But look, it's straight in the direction of your target!"

On the ISO 9000 of golf — get the proper procedures and infrastructure in place, and you'll pave the way for the ball to sail over the green and drop neatly in the hole. (Okay, I'm kidding!) But still, consider Microsoft Corp. A common, often-cited view of that software giant holds that the company doesn't reign over the industry on the merits of superior technology; rather, Microsoft is impelled by its powerful marketing machine. But I would suggest Microsoft's ability to offer solutions, the end-to-end offerings it envisions is paramount to that company's success story. While people may chuckle about such quips as "Bob," very few would argue that Bob's idea is the inventor of the "Office" concept. That said, Microsoft's various strength-bundled into one integrated (at least they're finally getting there) solution and courtingly gaudy towards the devolving of WordPerfect from an established position as word processing market leader. It's that old "parts are greater than the whole" adage — alive and kicking.

Consider the vendors with whom you like to deal. Their product offerings may be your paramount concern, but don't such factors as their services, support and ease of doing business also rank high on your checklist? (Speaking of services, see "Cooperating On Co-ops," page 56, by David Ross, for an examination of vendors' different co-op advertising and marketing efforts.)

Of course, we wish that products were all 100 per cent innovative and technically flawless. However, if your partner treats you well and fairly, goes out of the way to meet your needs and those of your customers, you'll have some patience for a few problems with a product or service.

That's particularly true if your vendor or distributor partner takes responsibility, quickly fixes the problem and gives above and beyond the expected in the process.

Intel Corp. found itself in the midst of a media fiasco when it tried to push push expressed concerns about the accuracy of the original Pentium chip. Instead, Intel got off a lot lighter by better handling the discovery of the most recent Pentium Pro/Pentium II bug through publicly owning up to the "error" and quickly working on ways to fix the problem. (For the latest on Intel and the marketplace, check out Jeff Evans' "The King is dead, long live the king!" on page 22.)

Your own customers may not expect absolute perfection, but they do want honest, eager service and need to feel that you truly value their business. And while a complaint can be a blow to even the sturdiest of egos — in this industry, a complaint can be very valuable! Indeed, studies show that if a customer complaint is resolved to satisfaction, that customer will have greater loyalty to the store than if there had never been a problem in the first place!

How wonderful! If you build an infrastructure that is supportive of your customers and you are eager to provide the solutions they need; then when mistakes do happen, you can actually capitalize off of them!

And your staff ought to be your most valuable resource. They are the interface to your customers; and if you've got technically apt, pleasant user-friendly interfaces — you'd better keep and develop them! Douglas Gray addresses the tricky issue of optimizing your staff in "Motivating Your Employees For Increased Satisfaction And Profits" page 55.

Of course, your product line is crucial. Check out our Lab Test on mid-range Pentium systems (page 26) and our special report on flat-panel displays (page 40). We also examine the growing market of notebooks (page 46) and wireless technologies (page 42). After all, if the golf ball really didn't matter, why does my instructor keep remanding me to keep my eyes on it?

Enjoy your summer, and drop us a line with your comments or concerns on the industry and this magazine. We're also accepting golf tips. — DR

## PageMart Wireless

Delivering More Than Just the Message™

### Redefining The Wireless Industry Together.

#### **Believe In the Opportunity**

Canada represents a huge opportunity for wireless messaging. Market penetration is only 4 percent compared to 16 percent in the U.S. and more than 20 percent in the Pacific Rim. As a PageMart Dealer, you will capitalize on this amazing opportunity and realize new profit potential!

#### **Believe In Technological Superiority**

From our RLEX™ satellite-based transmission network to our single frequency International coverage and our unique internet gateways, PageMart is on the cutting edge of wireless technology. That means greater flexibility and a superior product to complete your technology offering.

#### **Believe in the Ultimate Competitive Advantage**

PageMart's revolutionary network design and innovative approach to distribution provide an unparalleled opportunity for you to participate in the Wireless Explosion. Our Dealer support team will ensure you get up and rolling quickly, and will provide on-going support as your paging business grows.

#### **Believe In Flexibility**

PageMart's flexible Dealer Program makes it easy for you to sell paging products and services. We have three separate options - the Agent, Retail or Reseller program. One will be right for your business. Join the PageMart team now... and watch your profits grow.

**PageMart's innovative dealerships will give your business extra profit, a complete product portfolio and a meaningful competitive advantage.**

**Cannot attend Comdex**

I was appalled when I first received my free guest pass to Comdex and read the age limit. I'm currently 17 years old and have been reading a user-created computer recycling business for over two years. I must keep current with all the developing trends and technologies in the computer industry and must maintain a reputable network of suppliers.

Now that I cannot attend Comdex, I will have to take the responsibility I will lose some of my ability to compete in this already cut-throat market due to the pronounces missed and lack of contacts made. Since I am the owner, I make all the purchasing decisions for the company. This is \$50,000 to \$60,000 which the exhibitors are losing out on because I'm not "qualified to make a buying decision." It is then less as well as more as I will not be able to benefit from their expertise and products.

**Comdex age restriction is shocking**

As a young entrepreneur, only 30 years of age, I am shocked and appalled at the decision of Comdex to restrict entrance to the event based on age.

Since the age of 13, I have run my own computer, internet providing and training business from a road store located in Grangefield, Ont. I have attended seminars, conferences and trade shows all over the world and, yes, I have never once been told that I am too young to participate. Last fall, for example, I flew to Las Vegas to attend the largest Comdex event in the world. While there, I had the opportunity to collect information and meet many influential business contacts. Had age restrictions prevented me from attending the event, I may certainly would have missed out on an exciting world of possibilities.

In all, I know as a young entrepreneur and business man, that youth represent an integral part of the computer industry.

Tyler Peters  
President

Unique Computer & Communication Solutions Inc.  
Grangefield, Ont.  
tpeters@uacs.com

**Comdex must maintain business atmosphere**

We asked our exhibitors last year what they felt would help qualify the audience and their response was "no kids." We understand that there are those people who feel they are decision makers for companies and they are also the age of 21. Those folks will maintain a business appearance and act appropriately to maintain the quality of the audience. All some events, kids come to get the "free stuff" and are not the type of attendees that exhibitors are looking for.

I believe that this policy will not only help qualify our attendees to our exhibitors but also maintain a business atmosphere that the Comdex "brand" is known for. — SP

## INDUSTRY FLASH!

Visa, Mastercard publish EFT protocol standard

(NBB) — Mastercard International and Visa International announced the publication of SET L2, an open industry protocol that details how payment card transactions on the Internet and other open networks will be secured using encryption technology and digital identification.

Both MasterCard and Visa have a big stake in the future of electronic fund transfers. MasterCard International has 480 million credit and debit cards accepted at more than 14 million merchant, cash and ATM locations worldwide. Visa's 551 million cards are accepted at more than 15 million locations worldwide, while its Global ATM Network, consists of more than 316,000 ATMs in 109 countries.

The newly published SET 1.0 specification, which is available at <http://www.mcafee.com> and <http://www.VISA.com> on the World Wide Web, includes business requirements, technical specifications and a *non-technical* guide.

Stephen M. Bier, Visa's senior vice-president of Internet commerce, said "SET will enable our members to extend their relationships with consumers and merchants into the virtual world with the same trust and confidence that these groups have today in the physical world."

### **Cross Pen enters electronic writing market place**

The A.T. Cross Company, long known for its high quality traditional writing tools, entered the digital age on June 2 at the Spring Comdex in Atlanta with the introduction of a range of electronic writing products. Cross rolled out its new *Flexi* line of "natural computer writing tools" aimed at increasing productivity in "fax, word processing, graphics, and other 'electronic paper' applications," according to the company.

The iPen consists of a pen and tablet which can be installed for use on any Windows PC with a nine-pin COM port. It can perform all the functions of a mouse in addition to handwriting, tracing or sketching input. The pen and tablet surface offer a unique, patented 'pen on paper' feel to users, a feature that makes learning to use the iPen quicker and more enjoyable.

about \$199, and will ship in quantity in October. The iPen will be available with a bundled version of Symantec's WinFax PRO for about \$275, and with the Cross Handwriting Recognition Software Suite for about \$375.

### Compaq rolls out hefty workstation offerings

Looking to take on those markets traditionally dominated by Unix workstations, Compaq Computer Corp. has launched its Compaq Professional Workstation 6000 and Professional Workstation 8000, running Windows NT on Pentium II and Pentium Pro processors.

Indeed, the Workstation 8000 supports up to four 200MHz Pentium Pro processors with 312KB cache, and up to 3GB of memory.

"The workstation sell is really a server sell," said Karen Pailey, product manager, workstations, for Compaq Canada Inc. She said the workstations differ from Compaq's highest-end PCs, in that "the architecture is different. They're built from the ground up with NT in mind, to optimize their performance for NT."

Albert Desaut, analyst for market research firm Evans Research Corp., pointed out that Compaq has already established credibility for multiprocessing systems. He said Compaq sells 90 per cent of the Intel-based quad-processor servers sold in Canada. "Compaq is significantly ahead of the market with its quad products." But he pointed out Compaq will be competing only with the low-end of the Unix workstation market.

The Compaq Professional Workstation 6000 starts at a list price of \$7,935 for models with a 200MHz Pentium II, 64MB of RAM and a 4.3GB hard drive. The 8000 will be available, early in the third quarter, starting at a list price of \$17,250 for models with two 200MHz Pentium Pro processors, 128MB of memory and a 4.3GB hard drive.

### Rainbow Technology aims to sink pirate problem

Software piracy is estimated at over \$11.2 billion worldwide, a major of increasing concern not only to software developers, but to governments and end-users.

The increasing determination to combat software piracy has created a lucrative market for Rainbow Technology's anti-piracy products which are used by software developers and users worldwide.

On June 2, Rainbow Technologies showcased its new Sentinel Wizard, a

Compaq Professional Workstation 8000

**SENTINEL WIZARD™**

GUI implementation tool intended to work with the SentinelSafePro software protection key. The Sentinel Wizard is a piece of software that allows programmers to implement anti-piracy features in their programs with a minimum of difficulty.

For more information, contact <http://www.rainbow.com> or call 1-800-352-8359.

### Oracle, Informix settle lawsuit about trade secrets

(NB)—Informix Software Inc. and Oracle Corp. have announced the dismissal of a lawsuit brought against Oracle and 13 engineers who had resigned from Informix in January to join Oracle.

Allegations were the 13 had taken trade secrets with them when they went to Oracle, putting Informix at a competitive disadvantage. The companies compete in the database market.

According to a joint press release the companies stated that "Through discovery Informix has learned that Oracle and the engineers have not misappropriated or disclosed any confidential Informix information and that Informix's trade secrets are adequately protected. Informix rejects any statements or allegations that the engineers misappropriated any trade secrets or disclosed them to Oracle. No secrets changed hands."

Informix and Oracle stated neither would have further comment regarding dismissal of the lawsuit.

## Digital will use AMD chips, not Intel, in Venturi PCs

(NBS) — Digital Equipment Corp. plans to add Advanced Micro Devices' low-priced K5 MMX enhanced processor to its Venturi FX-2 desktop computer line — and not processors from Intel.

The K5-based systems join Digital's full line of Venturi FX-2 computers that already use Intel's Pentium and Pentium with MMX processors.

According to Paul Foyt, vice-president and general manager, commercial desktop business segment in Digital's PC Business Unit, today's announcement offers PC users "a broad choice of processor performance levels at aggressive price points." The AMD K5-based systems are priced 14 per cent less than a similarly performing Venturi FX-2 Intel-based system, Foyt said, "using the Windows 95 benchmark as reference."

## On-line software library allows shoppers to try before they buy

There's no such software in the world. In North America, there are more than 50,000 software companies and 250,000 software titles in existence. Literally thousands of new titles are added every month to further expand an already impossibly large market. This creates a very difficult situation for both consumers and publishers of software.

Consumers would like find out about what software is out there, and to try out software before buying it, but few retail outlets can offer the capability to run software on a computer in the store.

Publishers would like to get their products in front of the widest possible range of customers, but few retail outlets can stock or promote the thousands of different titles available for any particular computer platform, instead concentrating by category on a slim selection of a few dozen, or at most a few hundred likely sellers.

DemoNet offers five ways for users to search for software, by a Top 15 Categories, Top 50 Categories, Full Index of Titles, Search Engine and Product Code. The success of the DemoNet venture would seem to depend on whether publishers will see the advantages of the service, and software users will utilize the site to a sufficient degree to make it a viable marketing and sales medium. Contact <http://www.demonet.com> or call (562) 308-1000.

## CompuServe looking to resume growth in the age of the Web

CompuServe has announced an aggressive marketing campaign intended to expand CompuServe's subscriber base among high-end, sophisticated computer users. According to Scott Kauffman, CompuServe's vice-president, "CS's unique demanding consumers whose work and lifestyle needs are not met by mass consumer services, including a high proportion of business, professional and technical users."

To back up their claims of preferred, reliable subscriber access to the wired world, CompuServe invested in new state-of-the-art data center. A complete transition of CompuServe-to-Web technology (Web browser and HTML-based) is expected to be completed by the end of the year. A mix of 33.6 Kbps, ISDN and 1,600 lines have been deployed to make easy access easier and faster. The current innovations, CompuServe claims, will result in increases in speed of connecting to the Internet and posting or retrieving information ranging from 50 per cent to 10 times faster.

## Canadian News

### Canadian PC server market had a good year, says IDC

(NB) — The PC server market continued to grow in 1996, according to International Data Corp. (Canada) Ltd. The reasons included a proliferation of local-area networks, sophisticated applications, Internet and intranet activity, and the adoption of such new technologies as the Pentium Pro processor and Windows NT Server. IDC said 36,000 PC servers were shipping in Canada in 1996, up 24.1 per cent from the previous year. Revenue grew 23.8 per cent to \$263 million, IDC added. Compaq remains market leader.

### Matrox, ATI battle for PC graphics markets with new cards

At Comdex/Atlanta, the two Canadian firms of the graphics card industry clashed with innovative, affordable new PC graphics cards.

ATI announced the new XPERT®/Work and XPERT®/Play cards, the former aimed at corporate and SDHD users, the latter at the gaming and entertainment PC user. Both cards offer leading edge 2D and 3D performance, and high quality digital video and DVD support. The XPERT®/Play incorporates a TV-out feature that allows PC games to be viewed on a television set as well as a computer monitor. The DVD support of the two new cards is quite sophisticated, with motion compensation to give a picture-free, smooth playback of DVD/MPG-2 movies. The ATI Image-TV2 gives output to NTSC or PAL televisions which ATI claims produces "the best flicker-free graphics for big screen and wide screen TVs." ATI also

showed its "All In Wonder" card, which includes digital video capture, editing and output options.

Matrox rolled out the Mytique 220 and Matrox 220 Business graphics accelerators. The Mytique 220 is designed for SOHO and entertainment PC users, and comes bundled with common games titles, MPEG playback software and optimized drivers. The Matrox Mytique 220 Business bundle includes graphics applications software, including Micrografx Simply 3D and Painter Publisher 7. Both new bundles can be further upgraded with the Matrox Rainbow Reader video add-ons, which enable video editing, video conferencing, frame grabbing, hardware MPEG playback, and output to TV from your PC.

## Corel Office for Java popular on the Internet, says company

Corel Corp. has announced that tens of thousands of users have downloaded the beta version of Corel Office for Java since April 2, when the official beta service was made available for free download from the Corel Web site (<http://www.corel.ca>). The Java suite has generated great excitement in the computer market, as it promises to be the most comprehensive business productivity software title yet being developed using the Java programming language.

The suite includes Corel WordPerfect for Java, Corel Quattro Pro for Java, Corel Presentations for Java, InfoCentral for Java, and CorelChart for Java. As a complete integrated suite, the Corel Office for Java goes far beyond most of the other Java software "applets" shown until now.

According to Corel CEO, Michael Cowpland, "Corel Office for Java demonstrates the power and flexibility of the Java programming environment."

The commercial release of Corel Office for Java is expected before the end of the year, and may be a critical component in the rollout of the first generation of Network Computer devices.

And in preparation for the expected June release of Corel WordPerfect Suite 8, the Standard Released To Manufacturing (RTM) version of the suite was announced on May 20. According to Cowpland, "Corel WordPerfect Suite 8 includes state-of-the-art applications which offer a new level of responsiveness and performance with advanced features that make publishing and presenting on the Web a routine practice."

The Corel WordPerfect Suite 8 will be sold under a variety of pricing plans, including upgrades for registered WordPerfect users and users of competitive products, and special academic pricing. For more information, contact (613) 728-8826 or see <http://www.corel.ca>.

## Falling prices are shrinking Canadian printer revenues

(DNR) — Revenue from printer sales in Canada dropped 11.3 per cent to \$623 million in 1995, according to Evans Research Corp. One reason was a sharp drop in the prices of color ink-jet printers.

Evans Research said the laser printer market is shifting toward the high end, with printers that turn out eight pages or fewer per minute losing favor while demand for those that handle 20-or-more pages per minute is growing.

Multi-function peripherals are also increasingly important, with unit shipments reaching 80,000 in 1996 and expected to top 200,000 by 1998, according to the report from Evans.

Revenue growth will resume, but it will be 1998 before revenues match 1995 levels, Evans said.

# Comdex — from Atlanta to Toronto!

Trade shows are the most intensive way to become immersed in the leading edge of the technology wave — to listen to the big names and visionaries in computing, to get hands-on with the latest hardware and software, and to make personal connections with literally hundreds of computer industry professionals, resellers, end-users and journalists (90%, there are great parties).

It might be excessive to attend two Comdexes within a little more than a month, but in the last couple of years, computer trade shows have

become less uniform, and more idiosyncratic. Although there will be some overlap in exhibition between these two Comdex shows, there are literally hundreds of exhibitors who choose to be at either Atlanta or Toronto this year. 1997's Comdex/Spring (June 2 to 5) and Comdex/Canada (July 7 to 9) are two very different shows with significant variations.

## The Last Spring in Atlanta

The 1997 Comdex/Spring was the last Comdex which will ever be held in Atlanta. Last year's show was pre-empted due to the 1996 Summer Olympics, and all future Spring Comdexes will be held in Chicago, where Softalk, the company that owns the Comdex shows, has signed a 10-year lease. So, in a way, this year's Atlanta Comdex was a farewell performance. Some of the big brand names were conspicuous. In other absent (Compaq, Dell, AST and Apple were no-shows), but many of the industry's leaders (Microsoft's Bill Gates, Oracle's Larry

Ellison) were in attendance, along with many of the leading firms in the industry (IBM/Lexis, Corel/Hutch/AT&T/Motorola).

DVD technology was at the form of real products — with leading edge DVD-compatible graphics cards from ATI, a recordable DVD drive from Hitachi and an OEM MPEG-2/DVD playback card from Sigma Design.

Flat panel displays were all over the show floor, with a very impressive 48-inch model from Mitsubishi Electronics, which can be hung on a wall like a picture (with a very sturdy picture hook — it weighs 63 pounds). Other flat screens were shown by Deltac and Goya among others.

The Java wave was in greater evidence, with Corel showing a very late beta version of its Corel Office Suite for Java and IBM demonstrating its own Java-friendly network terminals.

In the graphics field, Fractal Design demonstrated the latest versions of its Painter, Poser, Goo and Designer 3D programs, while at the same time announcing its merger with Metropolis to form Metropix — intended to be a major new player in the graphics field. Toronto-based MGI demonstrated its science version of Video Wave, a very impressive digital video editing and effects program. Real 3D showed its real-time 3D rendering engines, and Play Inc. showed its soon-to-be-released Trinity digital video system, a US\$10,000 wonder which will allow PC users to match and surpass the video muscle of the legendary Video Toaster.

## I Can See Clearly Now

In a keynote, Microsoft CEO Bill Gates took every opportunity to disparage Java and the Network Computer in comparison to the PC and Windows, a manner that seems to indicate that he is seriously worried about the potential of Java and the NC to steal market-share and

By Jeff Evans

revenues from Microsoft. He became more irritated when he discussed his concept of the "digital nervous system" a metaphor to describe the world business environment that has been rapidly evolving in the last few years.

Oracle CEO Larry Ellison came on stage without his glasses and discovered that he couldn't see the computer screen clearly enough to demonstrate the new CNN/Oracle on-line news service. He crushed the first PC he was attempting to perform his demonstration on, and then blamed his problems on Microsoft (it "must have been a Windows bug," he claimed). He then struggled along on the Network Computer (NC) terminal beside it.

After his glasses finally appeared, showed how the new service will work.

In conversation with Canadian Computer Wholesaler after the keynote, Ellison emphasized his belief in the future of Java and the NC, claiming that in a networked world, it makes much more sense to use powerful servers to increase the usefulness of the Internet and other forms of network.

## And On To Hogtown

Comdex/Canada '97 in Toronto will be a substantially different show from Atlanta. Many more PC vendors will be there, taking advantage of Toronto's central position as a focus of decision making in Canadian industry and government. The Canadian high tech community will be out in force, and although some of the same themes will be repeated (PostNet MMX and Penman Pro, the Internet, DVD, electronic commerce — many of the vendors and the products will be different from those who were in Atlanta, and the sessions will have a Canadian slant. Plus, unlike Atlanta, indications are Toronto will boast a Comdex for years to come. III

# Digital TV: The PC's Next Frontier?

by Jeff Evans

According to some industry survey statistics, computer monitors are now outselling television sets in some parts of the world. In many households, hours of television watched each week have declined as people spend more time surfing the Web, playing computer games or doing work on the home office PC.

For the giants of the personal computer industry — Microsoft, Intel and Compaq — an exciting opportunity for future growth is "convergence," the coming together of the computer, telecommunications and television into one big, integrated megadevice which the PC is ideally suited to exploit. Of course, to Bill Gates of Microsoft, Andy Grove of Intel and Richard Hefner of Compaq, the centerpiece of every 21st century home's info-shrine should be a personal computer made by Microsoft, Intel and Compaq.

To this end, the three biggest brand names of the computer field played the role of the 800-pound gorilla. (As in the old joke, "What does an 800-pound gorilla do?" Answer: "Whatever he wants.") At the recent

National Association of Broadcasters (NAB) show held in early April in Las Vegas,

**Be Reasonable: Do It Our Way**  
Craig Mundie, the senior vice-president of the consumer platforms group at Microsoft claimed at NAB that a new era of broadcasting and telecommunications is dawning, where the next generation of consumer electronics technology will combine the best of the Web with the best of television.

Both Intel and Microsoft maintain that a digital television device with the power and flexibility of a computer CPU is the best platform for delivering entertainment and information to consumers. The powers that be in the television industry — networks, cable companies, TV program producers and TV and VCR manufacturers — are very dubious about the apparent attempt of the computer gods to "logjam" their industry. Compared to the frenetic pace of change in the computer industry, fundamental technical progress in television has been minimal.

The average fourth-grade kid in North America is viewing a lousy quality, low-resolution unencoded NTSC picture on his or her home TV set, blissfully unaware that this rep-

resents 40-year-old technology that the broadcasters have been too lazy to bother upgrading. Gates and friends have issued a challenge to the television industry, driving them to get on the bandwagon of the digital future — or else.

Gates has been active in showing the television industry some of the shapes of things to come. He has produced dozens of "shows" on the Microsoft Network, which are now watched by millions of MSN subscribers around the world. He recently declared his intention to purchase WebTV for US\$445 million by the end of the year, to give him a foothold in bringing the Web to non-PC users, via set top boxes and home television sets.

As it stands, the broadcasters are, compared to the young tykes of the PC industry in a reactive mode, not proactive, in dealing with the PC challenge. There is a lot of hand-wringing and complaining about how inherently complex and expensive moving television over to digital standards will be. The Advanced Television System Committee (ATSC), a group mostly recruited from, and serving the interests of, broadcasters and TV manufacturers is pushing for a digital television standard that would offer improved image quality without satisfying the bandwidth requirements for a major interactive computer component. The dividing line is clear — for a host of reasons, many broadcasters are either indifferent or actively hostile to the notion of a two-way Web-based interactive component to television. They would be very happy to keep the status quo of broadcasting, a one-way "top-down" model of mass programming and advertising delivery, and freeze out the computer guys.

Gates and the rest of the PCTV gang will press on regardless. Microsoft and others are recommending that TV tuner hardware be built into the next generation of home PCs as a standard, low-cost component, a move which is not comforting to TV set resellers.

If Gates has his way the market for computer technology in the home could be "an area of huge increase." That prospect should alert PC resellers to what could be the next bonanza for the home PC market. **III**

*Jeff Evans is Associate Editor of Canadian Computer Wholesaler. He can be reached at jeff@tpcon.com.*

## Vendors Align For Digital Television *by Grace Cozzolino*

At the 1997 National Association of Broadcasters Convention in Las Vegas, Compaq, Microsoft Corp. and Intel Corp. joined together to make technical recommendations based on a subset of the Advanced Television System Committee (ATSC) specifications, with a goal to "gradually accelerate the transition to digital television."

Microsoft, Intel and Compaq want support for the computer industry's video formats, digital data services and supplemental intelligence in the receivers.

They say the industry will let users play games, find out more information about their particular program, engage in "chat" discussions, and do lots of news and sports events. Both programming and advertising will be able to be passed to specific households, and even family members, say the companies.

Their view of the future doesn't currently exactly line up with the broadcasting industry but the computer companies say millions of PCs will be equipped to receive transmitted digital video and data as soon as 1998.

Compaq says the makers of digital televisions expect to sell one million sets in the next

four years — typically costing in at 1,000,000 or more per set.

Meanwhile, the computer companies say they'll sell 40 million DTV-enabled PCs in the next five years, 100 million by 2005. The incremental cost of DTV adoption is forecast at about \$400 per PC.

"I think we're going to see this battle on this basis alone," said Bob Stevens, senior vice president of technology and corporate development for Compaq.

Stevens said, "I believe it would be very naive for the computer industry to expect people to switch television sets to PCs as we now know [TV]. However, he said experts in the digital TV world tend to think of three different devices.

- The PC
- The PC/TV — a large screen system with a remote keyboard, allowing for PC-from-the-roads and PC viewing. "This is hot and new," said Stevens. "There's nothing special about it."
- The TV application — like today's TV set with non-TV "path" content, and viewers will be able to also extract information, for an augmented user experience, said Stevens.

## Study Pinpoints Success Factors For Canadian Value-Added Resellers

by Leslie Arrand and Margery Leach

Any software developer that has ever underestimated the importance of a well-conceived product distribution strategy (and survival will attest to the importance of the channel).

There is a lot more, however, to a good distribution strategy than simply implementing a channel strategy and engaging the right channels. Successful developers recognize that they must continually work with their channels to develop strong, mutually beneficial relationships. They also recognize that this is no simple task: developing and maintaining effective channel relationships challenges even the most successful companies.

In a 1990 study of 180 VARs, system integrators, distributors and dealers from across Canada, Brasheen determined the key factors that channel partners help to build loyalty and create successful development relationships.

Based on channel responses, the top five success factors that software developers must fulfill with their channels are:

- Channel orientation,
- Product availability,
- Effective/open communications,
- High product quality, and
- Strong technical support.

### Top 5 Critical Channel Relationship Success Factors

It is no surprise with today's constant flow of upgrades, patches and fixes that quality technical support is considered the cornerstone key to successful partnerships. Resellers require the best knowledge and support — and who is better positioned to supply the most up-to-date information than the developers themselves?

Channels also demand high product quality, simply because it is far easier to sell products that work and work well. Open two-way communication is also critical. The channel is in constant, direct contact with the end user and can provide the developer with useful customer feedback. The progressive software developer will seek out this feedback and incorporate it into future product and marketing plans, to strengthen the relationship with the end-user and increase product sales. On the other hand,

the developer knows how the product's functionality can help the channel drive product sales and ensure customer satisfaction by providing the channel with excellent and up-to-date product information.

While channel partners place a high value on regular communication with their suppliers, it must be at their own convenience. They far prefer electronic communication methods such as the Internet over face-to-face contact with their software suppliers.

It is incumbent upon software developers and channels alike to strive to maintain effective relationships. With a solid understanding of each partner's requirements, channel relationships will result in long-term benefit for developers, channels, and ultimately the end-user.

## Reader Poll

### We Asked You:

What is your opinion of Comdex/Canada's decision to raise the carry age limit from 16 to 21?

### You said:

Comdex took an appropriate action in raising the age of admittance to 21 years of age.

Comdex should have stuck with the previous age of admittance of 16 years of age.

There should be no age limit for attendees at the Comdex computer tradeshow.

### This Issues:

Wide viewing, high resolution flat-screen displays, based on LCD technology, are a norm on today's notebook computers.

the manufacturers are marketing increasing numbers of desktop displays. However, the traditional cathode-ray tube (CRT) monitors continue to dominate the display. Which model closely reflects your view of the flat-screen market?

There is a lot of interest in flat-screen displays, and we expect to see significant growth in demand for those products.

Flat-screen displays for the desktop will see success in certain markets, but for now won't attract mainstream buyers until the prices come down a little.

Flat-screen displays are just a niche market, and are far too expensive for the average consumer.

# Silicon Du Nord Spawns Noteworthy Software

by David Tanaka

Company	Product Name	Technology
G & A Imaging Ltd.	Photo Recall	digital image organizer
Unicat Network Inc.	Unicat Projects	project time billing
Softkit Technologies	Live Access	desktop document management

There's no doubt that Quebec has a few technology stars: Matrix with its video graphics cards, Protec Microsystems for networking products and Softimage, which Microsoft has scooped up, for example. But we don't tend to think of the province as a software center, particularly for the shrinking retail side. That may soon change. Over the past few months, I've seen three innovative software programs coming out of Quebec. They are all still a little rough around the edges, one being a Version 1.0 product, another just going through the commercialization process and the third is beta.

However, they show a lot of promise.

G & A Imaging Ltd. in Bell, Que., introduced a consumer retail product called PhotoRecall Version 1.0 this year. The product taps into the emerging consumer digital photography market. Some in the industry observe a growing desire amongst consumers to take those boxes of holiday and family snapshots and turn them into custom greeting cards, T-shirt images and other personalized photo mugs.

The tools in today's desire include inexpensive scanners and color inkjet printers, and easy-to-use image taking and layout tools on the software side — which is where Photo Recall fits in.

Photo Recall is primarily a digital image organizer. It allows users to catalogue, sort, view and arrange digital images. The program also includes a digital album creator, and a special effects image editor, but these are fairly lightweight modules.

Another strictly business application is Unicat Projects, from Unicat Network Inc. of Sherbrooke, Que. Unicat Projects is a comprehensive project time billing package. It comes in workstation and administrator versions. You can set up pay and overtime rates and holiday schedules; you can organize by departments and by project, and keep track of expenses and time spent. When you set up a project you can estimate time for completion, along with a budget estimate. The program then tracks the time and expenses of the workers assigned to the project.

There's a fineness that a worker can "push in" whenever they start on a project and then "push out" when they move on to some thing else. They can track billable time for number of different projects from a single window. In all, it's a slick piece of work. Unicat calls the current product Version 1.0, and has given it a suggested price of \$329.

Project organization of another flavor is the raison d'être of Live Access, a product being developed by Softkit Technologies in Montreal. Live Access is a desktop document management system that allows you to visually organize the documents on your hard drive into projects. It has a modern and stylish interface. It is Windows-Explorer.

One of the biggest drawbacks to desktop document management systems is data duplication. Typically you have your auto Efax, plus

another file in the document management system's proprietary format. Live Access makes extensive use of OLE to create a database of links and pointers, rather than a separate copy of the file.

# The King is dead, long live the King!

As the 'classic' Pentium

microprocessor moves off centre stage,

a host of new CPUs are  
jostling to become  
the king of the PC  
market-place.

About 80 per cent of the personal computers sold worldwide in 1996 carried Intel microprocessor CPUs inside them, according to figures from market research firms such as International Data Corp. and Datapax. "Intel Inside" is not only a brilliant marketing slogan and brand promotion, it is the simple description of the reality in today's PC industry: Intel seems dominant and unbeatable. A "no-brainer" for any PC moulder to choose as the basis for their business — for now, at least. But what about next year, or the year after that?

The so-called "Moore's Law," named after one of Intel's founders — Gordon Moore, states that as a rule of thumb, the maximum processing speed of the "state of the art" microprocessor doubles every 18-24 months, while prices remain the same or decline. Intel dominates today's PC microprocessor market so thoroughly as Microsoft dominates PC operating systems and business application software.

Up until now, the trend that beats the crown, however, in the case of the microprocessor market, Intel faces challenges from three CPU makers, from fundamental changes in the nature of computing devices, from approaching limits to the improvement of silicon lithographic chipmaking technology, and finally, from a shoving flock of lawyers. Intel CEO Andy Grove said it all in the title of his recent book: "Only the Paranoid Survive."

## A Year Of Transition

According to Doug Cooper, Canadian marketing manager at Intel of Canada Ltd., 1997 is a year of unprecedented transition in the Intel microprocessor line, with no fewer than four families of Intel Pentium processors holding a significant piece of the market: "classic" Pentium, Pentium II, Pentium with MMX and Pentium Pro. Pentium with MMX incorporating Intel's multimedia acceleration technology and extra on-chip cache memory, has rapidly come down in price, and become more attractive to multimedia home and business PC buyers.

As use of Microsoft Windows NT by businesses and power users has exploded, the Pentium Pro microprocessor has moved from an exotic choice to common place. The latest line of Intel CPU, the Pentium III, incorporates elements of both MMX and Pentium Pro technology. Intel has aggressively moved to develop low power versions of the Pentium with MMX chips for use in notebook computers; low powered versions of Pentium II with MMX and Pentium Pro can be expected as well.

## They Also Run: The Competition

There's lots of competition to Intel out there in the PC microprocessor market-place, and none of it is managing to do much more than just hang on at this time.

At the high-end, Digital Equipment Corp. has its Alpha chip, a speed demon that, along with Digital's system integration skills, results in computer volumes that beat any Intel-based computer in terms of raw performance. Cooper comments dryly however: "From a performance standpoint, Alpha has done well, but UNIX users are shifting to NE and in the NT market, Intel is preferred." End of debate? Digital is carrying with some success to increase sales of Alpha chip-based servers and workstations, but the competitive lack of Windows software compiled to run natively on the Alpha-computer version of Windows NT is a major handicap.

Similarly, the PowerPC chip, developed by Apple, IBM and Motorola as a higher-powered alternative to Intel, has not been able to continue delivering on its early promise. The PowerPC consortium was due to develop a version of the PowerPC architecture that would run the Apple Mac OS, NT and Windows operating systems and applications software on the same system: the so-called Common Hardware Reference Platform, or CHRP. The failure of the PowerPC consortium to come out of the gate with CHRP in the early 1990s meant that the PowerPC market was fragmented into Mac only and UNIX or Windows NT only segments, and this has limited the market prospects of the PowerPC alternative.

The MIPS microprocessor, originally developed by a subsidiary of Silicon Graphics, and manufactured by a variety of licensees seems to have decisively failed to remain a contender in the Windows PC microprocessor market. Versions of MIPS chips, however, are being sold in devices as different as the Nintendo 64 video game machine, set top boxes and Silicon Graphics workstations, servers and super-computers.

## Send In The Clones

Some microprocessor makers have opted to create clones of Intel chips, which offer the advantage of complete compatibility with Intel hardware and software. Cyrix Corp. and Advanced Micro Devices Inc. (AMD) are the best known of these companies, but their histories, of successes alternating with disasters, have made sellers

wary about committing wholeheartedly to these alternative CPU vendors. Currently, Cyrix offers the 6886 (the 'L' stands for low power) microprocessor as its top of the line alternative to Intel products. The 6886 corrects earlier problems the original 6806 chip had with overheating. The Cyrix chips are used by quite a few manufacturers as a budget alternative to broad-line chips, and they have good quality and performance. However, whether by coincidence or design, the latest models of Intel chips feature motherboards and chipsets that aren't automatically compatible with Cyrix chips.

AMD posed an apparently serious threat to Intel at various times in the late 1980s and early 1990s, with its 486 clone chips. However, the company had serious difficulties with some models of Pentium clone chips, and lost what had appeared to be an excellent shot at becoming a microprocessor giant. On April 2, AMD announced that it had begun shipping its long awaited AMD-K6 MMX processor, and claimed that the K6 "marks the renaissance of compatibility in Windows-compatible processors." The K6 is a very sophisticated microprocessor, based on the six-issue RISC86 superpipeline microarchitectural, and is claimed to be "smaller, faster, easier to use, more energy efficient and less expensive than Pentium Pro, making it the superior engine for Windows Computing," according to W.J. Sanders, the CEO of AMD. The K6 is also designed to be compatible with the Socket 7 environment, giving readers a widely available and economical range of motherboards, BIOSs and chipsets to use with the K6.

On balance, whatever Cyrus or AMD come out with microprocessors that are proven to be reliable and which are competitive in performance with current Intel models, at lower price points, a budget-minded segment of resellers and end users happily embraces them. Unless Cyrus and AMD establish an ardent cult of unsuccessful products, and develop some broad name credibility, however, they are likely to remain marginal players, laboring in the wake of Intel.

## The Morphing Of The PC

The PC as we currently know it may become a minority player in the world market for computing devices. Network Computers (NCs) may become a major market unto themselves, and they can use any microprocessor and accompanying chipset that will run a Java "virtual machine" to execute Java applications on a network.

Early NCs exist with ARM, Beagle, Intel and other CPUs. Java and the NC, if successful, could break the Windows PC paradigm and open up a whole new race for the top microprocessor. On the other hand, Microsoft and Intel are racing to strengthen the NC in its cradle, with their Mac PC and Windows Terminal concepts.

Portable computers running Windows CE are based on a variety of microprocessors, including Philips and Hitachi chips. Apple's MessagePad 2000 and i-E Mac 3000 portable devices are based on the StrongARM RISC chip. Other game-computer devices that don't need to run Windows software — phones with E-mail capabilities, Web browsing, and top boxes for your TV — all may take some new user sales away from Windows if they catch on. For now, though, the coming proliferation of non-Windows computers may affect Intel's dominance, but they are unlikely to dislodge Intel's eminence.

## Hitting The Wall

At some point in the next decade, the current microprocessor technology is expected to run into some fundamental physical limitations at the molecular level. It simply won't be possible to make smaller components to pack more transistors onto a chip, as the natural movement of atoms will interfere with the function of the chip.

Now, Wait Just One Atom-Picking Minute...

IBM's development of "nanocubes" includes the use of both

build machines start-by-start is considered to be one of the routes that computer makers will be attempting to use over the next few years to contribute to improving microprocessor performance.

Nanotechnology, which involves molecular manipulations to create submicroscopic machines, is science fiction today. However so was the microprocessor technology built into a cell phone or a laptop computer not so long ago. There are even research initiatives to create organic computers, and nano-machines that derive their power source from the living bodies in which they will be embedded.

Mars, this is Earth – The Digital Layout

Back in the real world of 1997 however, a much more mundane technology — that of the civil lawsuit, is raising at least a slight prospect that big-flying baci could be brought to Earth, on the grounds of alleged theft of intellectual property.

Intel has responded with a counteroffer, and at least an implied threat to cut off Digital from access to Intel products, which Digital

But whatever the outcome of this court case, it is worth noting Intel's competitors don't seem confident of being able to push Intel off the microprocessor throne by getting customers to abandon that "Intel inside" sticker.

# Mid-Range Pentium Systems

By Alan S. Miller, System-Wiz, and Steve McNeil

*New  
capabilities  
mean more  
appeal for  
demanding  
customers!*

**I**f the current trends in enhancements of Pentium processor technology continue, soon personal computers will look nothing like they do today and probably function quite differently. But whatever they look like and whatever they cost, they will be an integral part of our corporate infrastructure.

Intel's much-anticipated new Pentium processor with MMX technology has made an unexpected expedition into the desktop market. The enhancements that MMX technology adds to the new Pentium processor mean more than simply faster processors. Intel has added 57 new instructions that accelerate specific computational loops in multimedia and communications applications. The technology incorporates a Single Instruction Multiple Data (SIMD) paradigm, allowing CPUs to perform one

calculation on multiple data values simultaneously, boosting performance. In MMX-enabled software, the new technology will benefit such operations as 3D graphics rendering, image, video playback, and even audio.

These new enhancements are welcomed by graphic artists and multimedia developers. Even more rejoicing comes from gaming professionals who believe MMX was designed for games, especially when the anticipated benefits include branching interactive video, increased color depth, and higher frame rates. For those who can't have enough full motion video in the games, Intel promises MMX video will have much better quality, higher resolution, and improved color depth. This means that MMX will allow the ability to wander through tinted rooms with sharp, bone-looking full screen video to date. Furthermore, MMX allows multiple video execution simultaneously on the screen without any performance degradation. This is the single most powerful addition that will allow for more interactive applications than we have ever seen.

How does MMX perform in the real world? Results in our lab tests indicate performance increases between 10 to 15 per cent. Although we must point out that our test lacked software that was MMX-optimized. The MMX Pentium still performed faster because of its large 32KB cache—that's 16KB more compared to 16KB cache in non-MMX Pentiums. Even with MMX-optimized software, we don't expect to see anything like a doubling in performance at the same clock speed. An Intel spokesperson

agreed that the 15 to 20 per cent performance increases were observed with one MMX-enabled product consistent with the company's expectations for typical MMX applications.

## Pentium II

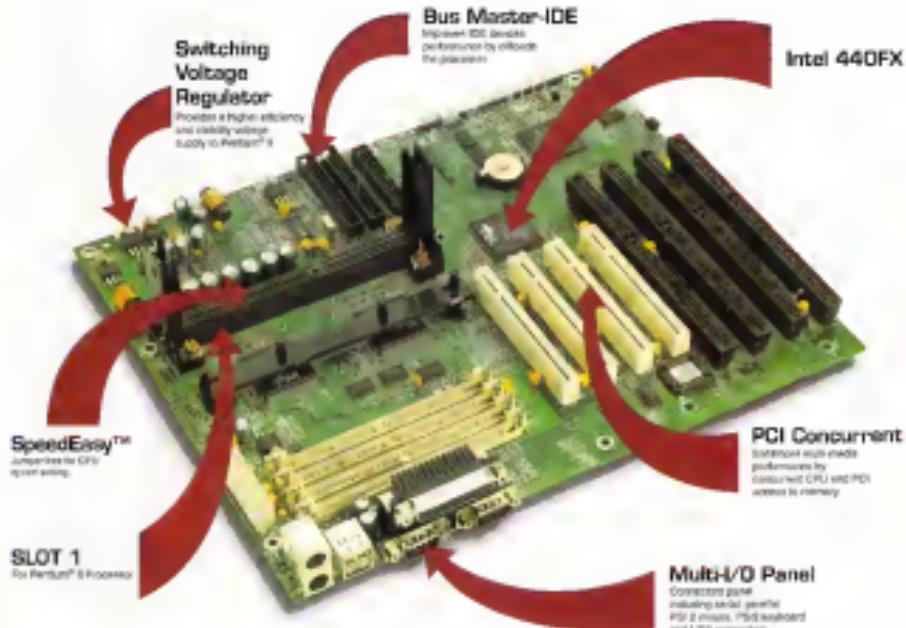

The Pentium II CPU is here. Like the Pentium, the Pentium II is based on Intel's P6 architecture. In addition, it features support for all 57 MMX instructions, improved 16-bit performance, and new chip packaging that will let system and motherboard vendors move to faster CPUs more rapidly than ever. But of course, as another story.

Every month new technological advances are made. Newer processors are emerging as are faster RAM technologies, faster and larger displays, and larger storage devices. Just over a year ago processors were at 133MHz, today the Pentium II processors are at clocking speeds of 266MHz. That's double the speed! This phenomenal growth of processor power will drastically change the way we do business and live before and after the year 2000.

## Our Tests

We selected vendors to send us machines configured with 166MHz MMX processors and 32MB of RAM. We left the remaining system components up to them, so long as they fit into the category of "mid-range." Our tests were conducted using the BAPCo benchmark suite of applications. All machines were configured to run at a resolution of 800 by 600 with a 16-bit color depth (65,536 colors).

**Business User Availability And Reliability:**

One system per authorized reseller at a 10 per cent discount.

**Compaq's View Of The Market:**

"Compaq CPM1660TX systems are for all markets of standalone or networked desktop and workstations for home/SOHO offices," says Alan Ng, president of French Computer Ltd.

**System Strengths:**

"All Compaq systems are designed to meet industrial server standards as if they will be running 24 hours non-stop. All com-

ponents and internal system layout are well selected and organized," says the company.

**Editor's Note:**

From French Computer Ltd. comes this Compaq system, packed with high-quality components that are sure to please any computer enthusiast. To start off, the system uses the latest motherboard from ASUS, the TX37, which incorporates the new 430TX chipset from Intel. The machine is driven by a 166MHz processor and is backed by 512Kbps of pipelined cache and 32MB of SDRAM. The graphics subsystem consists of a Winbond 3D LZ230 accelerator with 4MB of EDO RAM onboard. This card has helped systems from Compaq place among the fastest in their class when it comes to graphic performance. Multimedia accessories include a Sound Blaster 32 sound card, a new 24X CD-ROM from Panasonic, and a pair of 150W speakers. The 4.3GB Quantum Fireball ST with the new ADA-3 interface will provide more than enough storage room, as well as help overall system performance.

**Syntex VS 5166WME****Suggested Retail Price:** \$2,629**Street Price:** \$2,495**Reseller Price:** \$2,298**Support For Resellers:**

Co-op advertising.

Reseller referrals.

Two-year warranty includes parts and labor.

Toll-free tech support for resellers.

Web site includes technical information and drivers.

**Business User Availability And Reliability:**

Demo units have to be displayed for minimum period of 30 days.

**Editor's Note:**

This system has everything you need to get you up and running right out of the box, with a few extra goodies on the side all for just under \$2,500. To start off, we have the 166MHz processor, 512Kbps of pipelined secondary cache and 32MB of EDO RAM,

as well as the new 430TX chipset from Intel, all neatly laid out on an ATX form factor motherboard. For supreme graphics, the system includes a Matrix Millennium card with 2MB of WRAM onboard, and a Diamond Multimedia 3D card using the 3Dfx chip. The remaining components are top-notch as well, from the Sound Blaster 16 sound card in the 3.1GB Western Digital hard drive to the high speed Panasonic 24X CD-ROM drive. The latest from U.S. Robotics is also found inside the box — the new Sportster X2 56Kbps fax modem. Combine all of this with a pair of Yamaha M15 speakers, a microphone and a score of 188 on our benchmark tests, and you have yourself the makings of an excellent system at a very competitive price.

**Elio Systems****Suggested Retail Price:** \$1,720**Support For Resellers:**

Co-op advertising.

Reseller referrals.

Three-year warranty includes parts and labor.

**Elio's View Of The Market:**

"Our system is suitable for home and small business use as well as the educational market-place," says Stanley Tien, marketing manager at Elio.

**Editor's Note:**

A new competitor to our Lab Test has entered a box system from Elio Systems. The system consists of a 166MHz processor,

320Kbps of Level-2 cache, 32MB of EDO RAM, a Matrix Millennium video card with 2MB of WRAM onboard, and a 2.6GB hard drive from Fujitsu. For your multimedia needs, you get a Sound Blaster 32 sound card and a Cyber 16X CD-ROM drive. Rounding out the system is the very popular 33.6Kbps voice/Fax modem from Super-Easy. System performance was good with an overall score of 171.

NIKANA PR 2000

## IF YOU'VE BEEN ASKING WHY RESELLERS ARE CHANGING TO NIKANA PR SYSTEMS... WE CAN SUM IT UP IN ONE WORD...MORE!

**M**ore speed. With Nikana, you upgrade easily to the latest Intel Pentium®/Pro processor releases without dealing with major motherboard surgery.

**M**ore flexibility. Nikana PR systems boast ATX options, making Nikana one of the leaders in cutting edge technology.

**M**ore consistency. Nikana PR systems are noted for the consistency of the integrated components used, making

service and support of the Intel Pentium®/Pro processor series cost effective and predictable. No longer do you have to deal with the "flavor of the week" component products.

**M**ore margin. No more dealing with price wars due to over distribution in your region. Nikana PR systems are distributed solely through White Knight Distributing and the trading area monitoring programs provides for controlled distribution of the product line.

**M**ore quality control. Each Nikana PR system is quality controlled AFTER the custom configuration process is completed. A little peace of mind for you when you just have to get the product to your customer in a hurry.

**T**here is one area that Nikana PR products are noted to be less... COST! Just call your local White Knight Distributing office or visit us at <http://www.white-knight.com>

**Express Micro's View Of The Market:**

"Express Micro MMX 166 is a high performance system for the multimedia, digital video and business power user," says John Wong, director of marketing at Advance Interface.

**Editor's Notes:**

Advance Interface sent us this fully loaded machine ready to handle just about anything you throw at it. To start, it has the required 166MHz MMX processor, 312Kbps of pipelined cache and 32MB of SDRAM, and nothing but the best components money can buy: a Matrox Millennium video card with 4MB of high speed WRAM onboard, a Quantum FloppiST hard drive with a capacity of a whopping 4.3GB, Creative Labs' Sound Blaster AWE32 sound card and the latest in CD-ROM technology from Pleasanet, this new 24X drive. It may look like an ordinary floppy on the outside, but it's actually the new LS-120, from Iomega. This new high-capacity floppy drive is capable of reading and writing to a new type of media virtually identical in appearance to a regular floppy disk, but with a capacity of 120MB. A very compact system, with an excellent five-year warranty on labor and three years on parts.

**IBM PC 350****List Price:** \$2,345**Reseller Price:** \$2,200 (estimated)**Reseller Authorizations:**

**Demo Unit Availability And Restrictions:** Yes.**Editor's Notes:**

The system lacks many features found on most other systems in this survey, such as a sound card or CD-ROM drive. The

machine we reviewed came equipped with 8MB of EDO RAM, 256Kbps of pipelined cache and a 166MMX processor. For storage space, you get the popular Western Digital 2.5GB model, which offers not only excellent performance but adequate storage space. IBM also includes a copy of Lotus SmartSuite '96 at no additional cost. The machine's video subsystem is fairly basic, consisting of a 1MB S3 Treb4V+ card, which will offer a maximum resolution of 1,024 by 768 at 256 colors. For an additional \$600, your customers can have IBM's 15-inch model G50 monitor.

**KTX Enforcer****Suggested Retail Price:** \$2,990**Street Price:** \$2,299**Reseller Price:** \$2,099**Reseller Authorizations:** No.**Support For Resellers:**

Reseller referrals.

National advertising.

Two-year warranty includes parts and labor.

Web site includes technical information.

**Volume Discounts:** Yes.**Demo Unit Availability:** Yes.**Edge's View Of The Market:**

"This product is aimed at customers requiring high performance and excellent value, \$2000," says Campbell Angus, general man-

ager of Edge Wholesale, distributor of KTX systems.

**Editor's Notes:**

This very capable desktop system is configured with a Pentium 166MMX processor, 312Kbps of pipelined cache and 32MB of SDRAM, all housed on a Tyan T-2000 Turbo motherboard, making use of the latest 400MHz chipset from Intel. For maximum graphics performance, the system uses a Matrox Millennium video card with 4MB of WRAM onboard. Storage comes in the form of a 2.5GB hard drive from Maxtor, and for multimedia, includes the popular ESS 1888 chipset and a Maxx 16X CD-ROM drive. Rounding out the system is a 33 Kbps fax modem from Wisconsin and a pair of 120W multimedia speakers.

## THE ADVANTAGES ARE ASTOUNDING

As an ISO-9002 certified manufacturer, we make it our business to provide only the finest components for our customers. Our commitment to quality is the foundation for our products, service and innovative computing solutions. This commitment has been rewarded with achievement awards, Circle Cedars status for our NMSO offering, CSA and DOC certification and most importantly of all, loyal customers.

"PowerMate P2160M and PowerMate P2300M provide corporate users with improved overall performance and faster multimedia processing, as well as a full suite of software manageability tools designed to significantly reduce the total cost of ownership," says

Gord Nell, manager of systems products for NEC Computers Systems Division Canada.

**Editor's Notes:**

If your customers are looking for a system bearing a name you recognize and want a nice combination of popular components, the NEC PowerMate line of computers are just they you need. The model we tested was the 2320-2483C which consists of the following configuration: a 166MHz Pentium MMX processor, 256Kbps of pipelined cache, 32MB of EDO RAM, an ATI video card using the latest 3D Rage II chipset configured with 3MB of SGRAM, a Sound Blaster 16 sound card, a 3.5GB hard drive from Western Digital and a Goldstar 16X CD-ROM drive.

Dedicated technical BBS

Web site includes dealer-specific space, technical info and drivers

**System Strengths:**

"Our system is cost effective, ready to build, customer configuration," says Samir Ibu, purchasing manager at Eupec.

**Editor's Notes:**

The Azura system we received this month has a nice mix of components that will satisfy anyone looking to buy their first MMX

system. Its configuration consists of a Pentium 166MHz processor, 512Kbps of pipelined cache, an ATI 3D Pro Turbo 4PC27W video card with 4MB of SGRAM, an SB AW32 sound card, and a Seagate 2.5GB hard drive. The ATI video card will provide good performance for most graphics-related applications, and will deliver high resolutions thanks to its complement of 4MB of RAM. The card also has the ability to render the PC's output to a large screen TV. This system also includes a Toshiba 16X CD-ROM drive and a GVC 33.6Kbps fax modem. As far as performance goes, the system scored 178 on our benchmark suite, which was pretty well the average for this month's review.

**Demos And Availability:**

One demo unit per model per state location

**STD's View Of The Market:**

"The Pentium TX Chipset is the latest Pentium chipset. With the enhancement of multimedia, this product is targeted for the home user in the future when the price comes down," says Wilson Wu, project coordinator at STD.

**Editor's Notes:**

The system we received from STD this month is a great example of what you can buy for just under \$2,000. Inside the box is a 166MHz processor, 512Kbps of pipelined cache and 32MB of EDO RAM. The video subsystem consists of an S3 VBRGE 3D video card equipped with 3MB of EDO RAM. Performance on this card will not be on par with that of the higher-end models, but it will meet the needs of most consumers. Multimedia is delivered with the help of the now and already popular 24X CD-ROM drive from Promise and the well known Sound Blaster AW32 from Creative Labs. Storage needs are met with a 2.1GB drive from Quantum. With the included 33.6Kbps Wincom modem, you'll waste no time getting on line the minute you unpack the machine.

Your POS client just told you their POS hardware is toast.

Who are you going to call?

As an Authorized Repair Centre for a number of the products we sell, SDMS also services and repairs, in-house, all the products in our product line. We will also service and repair hardware (in our product line) for your customers, even if we didn't sell it to you. Down-time on any POS product costs your customers time and money. Why send a POS unit to be repaired to a person that fixes toasters, when you can have it repaired by people who know how to fix POS hardware. SDMS has been in the POS hardware business for 10 years, it's our specialty. Give us a call, your customers will definitely appreciate it.

POINT OF SALE HARDWARE SPECIALISTS

**Delta****Suggested Retail Price:** \$1,999**Street Price:** \$1,899**Reseller Authorization:** None**Maintenance And Technical Relationship With Reseller:**

One-year warranty includes parts and labor

Toll-free tech support for one year

**Reseller Comments:** "No."**Demo Unit Availability:** No**Editor's Notes:**

Delta computers are known for offering a lot of performance at a great price. The system we reviewed this month was no exception, featuring nothing but the best names in components, and finishing with one of the highest scores on our BAPCo benchmark tests. Under

the hood is a Pentium 166MHz processor, 312Kbps of pipelined secondary cache, and 32MB of EDO RAM.

For the best in graphics performance, the system makes use of a Matrox Millennium video card with 2MB of dual-page VRAM onboard. Matrox's accessories include a Sound Blaster 3D sound card and a 24X CD-ROM drive.

**Panasonic:** For the ultimate in performance and storage capacity, note yet a 3.1GB hard drive from Western Digital. Also included in the system is a 32MHz fax modem from Wincom to get your customers on-line right out of the box.

**Comtronic A-Open****Suggested Retail Price:** \$1,699**Street Price:** \$1,599**Reseller Price:** \$1,415**Support For Resellers:**

Co-op advertising

Twelve-month warranty

Web site includes drivers

**Demo Unit Availability:** Yes**Comments:** *"View Of The Market:*

"It will be the entry-level of desktops in the coming days. Since we are using 'tier-one' computer components, we believe this system is the most reasonably priced and reliable desktops."

says marketing manager, Eliot Lam.

**Editor's Notes:**

The A-Open system from Comtronic features the requested 166MHz processor, 312Kbps of pipelined cache and 32MB of EDO RAM. The 32MHz fax modem from Wincom is mounted on a mezzanine board from Acer, model APV9M. Graphics are delivered with the aid of an 83-VIRGE video card with 2MB of EDO RAM onboard. The hard drive in this unit is a low-cost 17GB model, ideal for anyone looking to save a few dollars when performance isn't the number one priority. Rounding out the system are a slew of Acer components such as a 16X CD-ROM, a 33-MHz fax modem and an Acer FSC-3D sound card. Performance on this machine was just slightly below the overall average, but the system's price more than makes up for that.

**Packard Bell CAN PLT 2015****Suggested Retail Price:** \$3,999 (including 15-inch monitor)**Reseller Authorization:** Yes**Support For Resellers:**

Co-op advertising

Reseller referral

One-year warranty includes parts and labor

Web site includes technical information and drivers

**Editor's Notes:**

Packard Bell's latest creation in desktop systems is the Platinum 2015. The system consists of a 166MHz processor, 256Kbps of pipelined

cache and 32MB of EDO RAM. For graphics, the PLT 2015 relies on an 83-VIRGE video card with 2MB of EDO RAM. Also included with this system is a 15-inch monitor, a Packard Bell model 3220. Storage comes in the form of a 1.1GB hard drive from Seagate, and a 16X CD-ROM from Goldstar. A differentiating feature of this system is the vast amount of software included.

**Santech Plus****Suggested Retail Price:** \$2,029**Editor's Notes:**

Computers from Santech are well known under the Pack brand name. The system we received this month was a well-rounded unit that offers fast performance at a reasonable price. Included in the system is the 166MHz processor, 312Kbps of secondary pipelined cache, 32MB of EDO RAM, a Trident 9642 video card with 1MB of DRAM onboard, a 16-bit sound card from Yamaha, a Celestion 16X CD-ROM drive, a 2.6GB drive from Fujitsu and an Acer 33.6

Kbps vga/RS232 modem. The machine managed to achieve a score of 162 on our BAPCo tests, slightly less than average due greatly in part to the slower Trident video card. Overall, this machine would make a great starter system for any home, especially considering its low price tag.

# Intel® Processor-Based System Boards

Intel® 430ITX ATX System Board

- Supports ACPI and OS Directed Power Management
- Ultra DMA/133 data transfer rate up to 1.3MB/sec
- Equipped with a switching power module that supports 2.8V, 3.3V, 3.2V, 3.1V and 3.0V
- Two DIMM sockets using SDRAM for enhanced performance
- Modem ring-in
- ATX power connector

Intel® 430ITB ATX System Board

- Supports ACPI and OS Directed Power Management
- Ultra DMA/133 data transfer rate up to 1.3MB/sec
- Equipped with a switching power module that ranges from 2.8V to 3.3V, 0.1V per step
- Two DIMM sockets using SDRAM for enhanced performance
- Modem ring-in
- ATX and AT power connectors plus ATX power supply for the ACPI function

Intel® 430IPVC ATX System Board

- Equipped with a 10 ampere low heat dissipation switching voltage regulator that supports 2.5V to 3.3V, 0.1V per step
- Two DIMM sockets using SDRAM for enhanced performance
- Supports USB, IrDA and DMX functions
- Low cost, high performance VX System Board

For Premium 43 Processor

- Equipped with switching voltage regulator that ranges from 1.5V to 3.3V
- PCI and parity check supported
- Supports EDO DRAM
- Supports USB, IrDA and DMX functions
- ATX form factor

2 Year Warranty

**Myxis Mycomp****Suggested Retail Price:** \$2,383**Street Price:** \$2,285**Reseller Price:** \$2,095**Reseller Authorization:** Yes**Support For Resellers:**

Calling advertising

Marketing funds

Three-year warranty includes parts and labor

Toll-free tech support

Dedicated technical BBS

**Demo Unit Availability And Restrictions:**

Demo units are available to volume resellers only

**Mythic View Of The Market:**

With the Intel 486DX chipset and the Ultra-DMV/32 hard disk, this system is top of the line in the Pentium Class system, says the company.

**Editor's Notes:**

Not only did the system make it through the entire benchmark song, but it did it flawlessly on the first try with no system hangs or glitches whatsoever. Not only that, but it managed to achieve the highest score of all the systems in this month's roundup, finishing with an overall score of 198. The system consists of a 166MHz processor, 512Kbps of pipelined cache, 32MB of EDO RAM, and the new 486DX chipset from Intel. For lighting fast graphics, the system uses a Matrox Myrisque video card with 2MB of high-speed SGRAM onboard. Storage space is anything but scarce with the 4.3GB Quantum Fireball ST. Rounding out the system is a 3TC 12X CD-ROM drive and an ESS 1650 sound card. If you're looking for the ultimate MMX system, get this Mycomp Vantage.

**Ultinet****Suggested Retail Price:** \$3,195**Street Price:** \$1,998**Reseller Price:** \$1,895**Reseller Authorization:**

Ultinet requires a completed reseller application with a provincial tax permit

**Support For Resellers:**

Reseller referrals

Toll-free 800# to its resellers

Two-year warranty includes parts and labor

Toll-free tech support

**Volume Discounts:** Available for large orders**Demo Unit Availability And Restrictions:**

Demo units must be paid for in advance, with a refund issued on return of the product.

**Mythic View Of The Market:**

The company says that system will become the de facto entry level

product by the end of the year. This is a high powered all purpose computer at an entry level price.

**Editor's Notes:**

Ultinet has once again managed to build a system that packs a punch when it comes to raw performance and provide high quality components at the same time while maintaining an aggressively priced machine. This month's system is powered by a 166MHz processor, 512Kbps of Level-2 cache and 32MB of EDO RAM, all on a 33MHz-based A380 motherboard. The use of a Matrox Millennium video card with 4MB of WRAM onboard and a 3.3GB Quantum Fireball hard drive helped this system to achieve a high score of 187 on our benchmark suite. Also found in the guts of this machine is a high speed 24X CD-ROM from Panasonic, a Sound Blaster 16 sound card from Creative Labs and a USB Sportster 53.6 Kbps modem.

**Performance**

This month's top performing system was the Mycomp machine from Myxis Technology. The machine has everything you'd want to ask for from a great video card to a super fast drive to an excellent price with a three year parts-and-labor warranty. For top performance on an MMX machine, Mycomp has it all.

**Price/Performance**

Without a doubt, the award for best price/performance this month goes to the A-Open system from Comtronics. For just over \$1,400 your customers get a complete 166 MHz MMX system with a 2.9 GB hard drive, a 36X CD-ROM, and a 3.8Kbps modem. If you're looking to sell a starter system that offers full multimedia capabilities but doesn't want to break the bank, this is the system for you.

**Overall**

The PowerMax P166M from NBC impressed us very much with its combination of quality components, good performance and attractive price tag. It features an excellent hard drive — a 3.1GB Western Digital, a super 16X Goldline CD-ROM and an ATI 3D Rage II video card with 2MB of SGRAM onboard. If a name brand company is important, and you want a good overall machine with a competitive price and warranty, the PowerMax P166M is an ideal candidate. **BB**

# Is Thinner Always Better?

*What are the advantages of flat panel displays over CRTs?  
What are the differences between LCD offerings?*

By Steve Hofenda

The world of personal computing over the last few years has been witness to a multitude of new products, many of which have promised to revolutionize the way we work with our computers. Some have undoubtedly delivered on their promises, while others are nothing more than a faint memory. The history of technological advancement has made it evidently clear that the measure of our progress forward is often directly related to our manufacturing abilities. It's true — the world around us is shrinking at a phenomenal rate, and we can't help but be both amazed and awe.

This month our *Lab Test* includes a brief report on the rapidly developing world of flat panel displays. Initially, these devices were used primarily in laptop computers, but are available today in standalone formats, ready to act as replacements for your desktop monitor. Or are they?

The panel displays have several advantages and disadvantages when compared to traditional CRT (cathode ray tube) desktop monitors. First, we have the very obvious issue of desktop space. With a flat panel display, you only need about one quarter of the overall space that you would otherwise need with a typical desktop monitor. These units are quite thin, measuring anywhere from 1.25 to 2.5 inches for the actual panel and an extra couple of inches for the base at the bottom of the unit. If desktop real estate is of great importance to you, one of these displays can be nothing short of bliss. Aside from being thin, they are very light, weighing in at approximately 10 to 12 pounds (less without the base). Compare that to a typical 17-inch monitor which weighs over four or five times that amount, and you quickly begin to realize that portability is a key advantage with these units. Should you ever need to move them from one place to another, you can easily do so without worrying about it being too heavy to handle. Quite often, the bases on most displays can be detached, making them ideal candidates for mounting on walls.

Inside a conventional monitor is an electron gun, a raster and a glass screen which is coated on its inside with color phosphors made up of red, green and blue. When the electron gun fires the electron beams, the mask is used to shield and direct the beams onto the individ-

ual phosphors. When the beam hits these phosphors, they glow, and in return we see the pixels light up on the monitor. The colors we see are determined by which of the phosphors are hit with the electron beam. Flat panel displays, on the other hand, do not have an electron gun. In the simplest of terms, think of the flat panel display as a huge grid made up of millions of tiny transistors. Each individual pixel on the screen is controlled by these transistors, one for each primary color. This technology offers several benefits over the CRT design. First and foremost is the radiation which is encountered in CRT displays. Since there is no electron gun present and no high voltage source required, flat panel displays are ideal for situations where radiation emissions and static are crucial such as in hospitals and laboratories. In CRT monitors, high voltage levels in the range of 15 to 30 kV (thousand volts) are present inside the unit. Flat panel displays consume significantly less power than any desktop monitor. The average consumption for these units seems to be in the realm of 30 to 35 watts (W), as opposed to an average 17-inch monitor which normally consumes up to 120W.

The biggest drawback to a flat panel display is the price tag associated with it. The models we reviewed were each well over \$2,000 for a 14-inch design. Those with larger viewable areas in the 17-inch or higher category can cost upwards of \$5,000. Fujitsu's PhotoVista 42 is a large-screen model with a viewable 42-inch measured diagonally. It has a list price of US\$13,999. Aside from the high price tag, image quality is another issue with these flat panels. At the present time, with the technology currently found in these units, the picture quality is not as good as on CRT displays. Viewing the same image on both a CRT monitor and LCD panel will reveal variations in color and sharpness. While some of the newer models boast exceptionally bright and vivid displays, it will be quite some time yet before they replace desktop monitors. **SH**

*Steve Hofenda is a Lab Test Editor for Canadian Computer Wholesaler. He can be reached at [steve@tigrus.com](mailto:steve@tigrus.com).*

## Media & Review

### **Hewlett-Packard**

HP's first attempt at a flat-panel display comes in the form of this 14-inch model. With a diagonal measurement larger than most 15-inch monitors, the LCD panel has a display resolution up to 1280 by 1024. The on-screen controls are in a 16-key menu and after a variety of different configuration options (between clarity and contrast), graphics were displayed in bright colors. The integrated metal price of \$3,336 and comes with a standard one-year on-site parts and labor warranty.

*Arrived: Printed Circuit, P.O. Box 267-267,  
<http://www.hplip.com>*

### **NEC MultiSync LCD400**

The MultiSync LCD400 from NEC is an excellent example of superb engineering design combined with features not found on competing products. Of the most notable features on this model is what NEC has termed "FullSense" copy technology. This allows you to use any resolution supported by the LCD400 in full screen's mode without a black border around the screen. What this means is that if you were running at 1280 by 1024 in a Windows environment and you opened up a 320 by 200 window, you would be able to maximize that 640 lines with the ALT-Enter combination and have it occupy the entire screen. This is a feature not available on the other two models we used. The LCD400 supports resolutions up to 1280 by 1024 at 1600 refresh rates. It has an estimated street price of \$3,680 and is covered by a three-year limited warranty. NEC will begin shipping the LCD400 in August of this year.

*NEC Technologies Canada, 1-800-388-0700,  
<http://www.nec.com>*

### **Philips Brilliance 4500D/AK**

The 4500D/AK from Philips is a 14.1-inch wide-panel, capable of resolutions up to 1280 by 1024 with a maximum refresh rate of 179Hz. It has a 16:9 aspect ratio and is common on most CRT monitors. The unit itself (without the base) weighs only 1.04 pounds, making it easy to transport or move. The Brilliance 4500D/AK goes one step beyond the other two models in one respect: it is integrated speakers into the LCD panel.

*Philips Consumer Division, 1-800-281-2448, <http://www.philips.com>*

OUR NEW SOHO HUB COMES WITH A  
FREE PCI ADAPTER. THAT SHOULD MAKE  
EVEN YOUR TOUGHEST CUSTOMERS HAPPY.

\* Designed just for Small Office Home Office (SOHO) environments, the new Kingston® Soho™ SOHO hub is a convenient, reliable, and affordable. The perfect solution for small office and home office users. And now when you buy a SOHO hub, we'll give it to you—FREE!

#### Uncompromised Ease-Of-Use

Available as 5- and 8-port configurations, our full-featured SOHO hubs are easy to install and troubleshoot – no networking experience required. And they are easy to find room for, thanks to a compact and form-factor and an optional in-line keyboard powerable PnP. An integrated hub-to-hub crossover port ensures there's plenty of room to grow.

#### Higher Performance And Value

Kingston combines efficient manufacturing with industry-leading components to

# Look Ma, No Wires!

By Paul Wensberg

*Many wireless computing technologies have been slow to gain widespread acceptance, but indications are the market-place is picking up.*

IN  
Communications

There are the fabled stories of mobile professionals who were supposed to roam around the globe with their laptops, cellular telephone and/or personal digital assistants (PDAs) — faxing, E-mailing and sharing data with the office?

"For five years we have been promised these solutions but they have never truly materialized," says Jeff Gillott, director for wireless and broadband networking at the Austin, Tex.-based office of International Data Corp. Gillott blames the lack of greater presence for wireless computing on a number of factors: varying standards by different cellular carriers, services that may be available in Asia but not in Mexico, premium pricing, and, consumer resistance to lugging around all that hardware on trips.

#### Wireless E-mail

The problem is not with the cellular phones but with the wireless readers which are supposed to access E-mail, says Gillott. "It is hard to do. I have to put my IT department involved. Then it isn't plug-and-play, but plug-and-pray."

The industry continues to produce interesting products like the Nokia 9000, a PCE digital cellular telephone/PDA available from the Finland-based Nokia. It contains a full

slide keyboard and screen. But the cost will be in the thousands once it is available in Canada, says Chander Bhawan, president of the Toronto-based Deltek Mobile Computing and author of "Mobile Computing: A Systems Integrator's Handbook." "None of these devices have the final form factor which consumers will accept. They are too big or bulky. These problems are not insurmountable. How do you pack so much functionality in a reasonable cost into a small space?"

**"People are seeing (wireless) as a viable means of putting in real-time tracking in the warehouse, as opposed to using paper."**

— Jeff Lem

Gillott is skeptical of efforts to marry the telephone and the computer, when the two have separate distinct functions. "I carry a phone because I want to talk to people and I carry a laptop because I want to work. I don't carry anything else (while on the road)."

Wireless E-mail is now available on cellular phones and pagers. The Interactive Pager, developed by the Winona, Minn.-based Research and Motion, for instance, allows for E-mail messages to be sent or received in a remote location outside such as an airport. In addition, connection can be established with the office via the Internet for protocol information.

Cellular phones and pagers function well if they serve as "display devices," says Gillott, presenting abbreviated information like stock quotations, the weather and short messages from the office. Service and repair are two vertical applications but these devices would never replace a laptop. "I am not going to read a five- or 10-page E-mail on a small screen," he adds.

#### Wireless LANs

Wireless local area networks, however, are starting to make inroads into the warehouse and distribution business where small and rugged data collection or pen-based devices

linked to servers in the office can be used to track thousands of merchandise in shipping and receiving.

It is mainly the large distributors which are adopting wireless LANs because of the financial payback from a more efficient just-in-delivery system, as well as the possibility of eliminating unnecessary labor costs, according to Jeff Lemo, systems specialist for Q Data Inc. The Markham, Ont.-based systems integrator designs the software interface that links handheld devices manufactured by Norand Data Systems Ltd. with one of the available warehouse/distribution packages on the market. Clients include The Liquor Control Board of Ontario, but somewhat ironically, not many PC distributors, which have been slow to introduce wireless LANs into their operations, he says.

"Wireless has been around since the Second World War, but it is starting to be embraced and accepted at the workplace because of the spread of cellular phones. People are seeing it as a viable means of getting at real-time tracking in the warehouse, as opposed to using paper."

In many cases, Q Data's integrated solutions are complementing with legacy mainframe systems in the client's head office, says Lemo. His company will also provide wireless wide area networking solutions which rely on satellite technology. Typically, a company will only go wide area if they want to link with sales or delivery people over a wide area."

But these are still very specialized vertical markets. So far, there is not enough market demand for wireless LANs within the cor-

porate and government accounts to warrant the creation of network-oriented VARs like Tom Atkins, general manager for Toronto Computers and Communications, in Toronto. "I have had some users even inquire about cellular modems. But most of them start looking at the costs and figure it is not worth it. Very few people go beyond an alphanumeric keypad."

But attitudes among end users are bound to change once the realization sets in that wireless technology can help fill existing data transmission gaps within organizations, says John Montgomery, responsible for sales and marketing of mobile wireless systems at the Markham, Ont.-based IBM Consult Ltd. "There is an opportunity for the properly skilled VAR to offer some value and services in the design, configuration and installation

## Will Digital PCS Mean More Business For You?

By Paul Lemo

As Canada's wireless communication industry grows, digital, greater opportunities for computer modularity are emerging. Today 2.8 million Canadians (which is 12 per cent of the population) use cellular phones. By 2001 38 per cent of Canadians will use wireless communication devices and Canadian mobile telephone revenue will exceed \$4.5 billion annually according to research group The Yankee Group, in Boston.

Corporate downsizing, combined with the growth in home-based businesses, means busy people with limited support staff are using wireless devices while on the road to stay in touch with the office, clients and suppliers. In addition, individuals concerned about safety while travelling have armed the masses with cellular phones. "Wireless products and services are revolutionizing the telecommunications industry," says Roger Parent, president, Canadian Wireless Telecommunications Association. "The mobile office is a reality. And through PCS (personal communications services), individuals will soon have one telephone number for all their communications needs — from voice and messaging services to fax and data transmission — anywhere, anytime."

### Cellular Versus PCS

In Canada, there is one national cellular carrier — Cellular AF&T (formerly Rogers Cellular) — and a series of provincial cellular companies that have formed a national consortium under the Mobility Canada umbrella. Bell Mobility, serving Ontario and Quebec, is the largest of Mobility's Canadian members.

No cellular, which means you can't use one phone cell or radio receive calls from world-class mobile phones and other wireless networks.

Existing cellular firms Bell Mobility and Cellular operate on the 800MHz cellular band (radio frequency). Analog networks have limited capacity and cellular users in major urban areas frequently have difficulty operating to the network during peak periods. To alleviate network congestion and to anticipate investment in new technology, Industry Canada awarded PCS licenses to Quebec Communications Inc. and Microsoft Telecommunications Inc., as well as to Bell Mobility and Cellular.

Digital from the ground up, PCS networks operate at the 1.9GHz radio frequency. Digital PCS provides much improved voice transmission as well as such as cellular identification (handset cell tracking and calling line ID), short messaging services (the ability to send and receive paper-like messages) enhanced clarity, privacy and reduced fraud.

### Then There's Mike

The growth in digital wireless communications goes well beyond voice and short message services. "Mobile radio is growing rapidly driven by technological innovation," says Parent. He cited the launch of Mike from Comshare Communications as an example.

Opening in the Winter to Bachech City can do Mike is Canada's first enhanced integrated mobile radio service (EIMR). Mike integrates a wireless phone, pager, mobile radio and other business applications in one handset. Mike will soon be available in Vancouver and Comshare users can operate Mike handsets in over 200 American cities.

### Mike Benefits

Of interest to computer users is the fact that Mike handles data. And it does it without the addition of expensive PC Card modems since the mobile function required for data communications are integrated into the Mike digital Mike-DEEN network. To send and receive data or fax from a portable computer, all one has to do is connect it directly Mike Motorola handsets to the computer's standard RS-232 communications port.

Armed with notebooks or portable computers and data-ready Mike handsets, sales representatives, service technicians and other road warriors will be able to send and receive faxes, transfer data files and E-mail while porting computers and corporate networks, interstate, Comshare, Airfone, Delta and the like at 9,600 bits per second initially.

These data communication services, combined with Mike's voice, page, messaging and two-way group or private-line services, mean Mike customers can receive wireless services than cellular customers — using less bandwidth. Modem functions integrated into the network mean Mike data users experience quicker call set-up, shorter data transmission speeds and more reliable data transmission compared to cellular data users.

### WIFI Opportunity

"The simplicity of the system is going to drive sales," says Greg Jonstone, manager, Comshare Mike division.

He also says Comshare is actively seeking computer resellers, including VARs, system integrators and software developers, to create value added products and services that will run on the Mike network.

"Using the Mike network VARs can now enhance the scope of repeat business solutions horizontal and vertical markets," says Jonstone.

All products and service developed by third parties to run on the Mike network will be tested, approved and supported by Comshare. One note is "not so much building a VAR program as it is building a solutions forum" that will benefit the end users, resellers and Comshare, says Jonstone.

So if you thought wireless meant people talking to each other over a cellular phone, think again. Digital wireless may mean enhanced sales and expanded margins for computer resellers. **EP**

Paul Lemo (<http://www.pcshare.com>) is a freelance writer specializing in high tech and telecommunications issues.

of a wireless LAN in their existing customer environments, where they have already provisioned the network, server and a lot of PCs."

Wireless LANs are not about to replace the existing cabled infrastructure within enterprise networks but it could cut our some of it, reducing costs and simplifying network planning in the process, he says. Visible options include improved building-to-building communication between two LAN segments a few miles apart and the establishment of links with an office in an older historical building or a harsh environment such as an industrial one.

"There are occasions where there is either a right-of-way, which can't be physically cabled or it is too cost-prohibitive," he suggests.

Also, enterprise networks were designed for employees to share data at their desktop PCs. But plenty

of anecdotal evidence indicates that many people at work spend much of their time away from their desks in meeting rooms, which often lack Ethernet or Token Ring ports that would facilitate connection to the network server. A wireless LAN solves,

says Montgomery, "provides employees access to enterprise data when and where it is required, so as to provide that level of mobility within an enterprise."

Meanwhile, PDAs and handhelds might have a new lease on life with wireless support.

To enter the wireless market, VARs are going to have to expand their understanding of telecommunications, says Deewar. Already, the cellular telephone vendors are starting to establish partnerships with application providers in the PC reseller community. "VARs will have more opportunity down the road, but it is not going to come in a big rush like the Internet. It is going to take time, it is going to be slow and steady." ■

## Taiwan's Computex spawns slew of products

By Douglas Alder

Taiwan is well known for such products as motherboards, notebooks, cases, power supplies, keyboards, scanners and countless other computer products. Here is a brief sampling of some of the technologies that were on display at the recent Computex computer show in Taipei.

### Chips

I saw a new chip called the C6 from IDT, which aims to challenge Intel on the low end of the Pentium scale, including MMX technology. The company's goal is to have a chip out within a couple of months that will be 60 to 70 per cent of Intel's pricing. The California company was in Taiwan promoting that chip to the motherboard manufacturers (<http://www.idt.com/c6>).

### The Land Of The Scanners

Aut, Unisys, Optex, Matsuk, Suntek and Plastic all had new units. The difference between each unit would need a full fledged lab to determine. A couple of products of note were a very pleasantly designed, including the Papercon-driven, sheet fed scanner from Aut's Virgin division. I got a glimpse of Plastic's new A3 size scanner under wraps in their booth (<http://www.aut.com.tw>).

### Notebook Computers

Bigger and smaller were the two trends I noted. Matsuk was showing a humongous 14-inch screen notebook. These units are starting to look like desktops instead of portables. Serious weight and power requirements are attached to this type of display (<http://www.matsuk.com.tw>).

Around the show were two or three units of the new Toshiba Libretto sub-sub notebook. The idea of these computers is to pack full-sized notebook features into something just a

bit larger than a Windows CE PDA. The Toshiba is an attractive little unit I found the pointing device and small keyboard made it almost unusable for my sized hands. I understand the unit in North America will have a larger keyboard. I was grateful for the almost full-sized keyboard on my Newton 2000.

I got a glimpse of a new machine from Matsukushi called the Autry CN. This sub-notebook is scheduled to appear in August or North America. The keyboard on this unit is far more spacious than the Toshiba Libretto. It is a little bit larger, but the fact that it is twice as wide makes the extra weight worthwhile.

(Takukubo — <http://www.matsuk.com.tw>)

A small company named Dong, had a four-port Ethernet hub on a PCI board. By eliminating a power supply and box, they can shave the price down to \$1548 at retail. This compares with \$1000 to \$1200 current pricing. The owner claims to have a patent pending on the idea.

(Dong Computer Ltd. — 886 2-216-2123; [Email: style@do.com.tw](mailto:Email: style@do.com.tw))

### Input Devices

I think I have seen a dozen small manufacturers of little handwriting recognition pads. These little surfaces are about two by three inches and allow the user to input drawings or signatures into your computer. Using the devices launches a pseudo clipboard program which stores input until the user selects the program into which they want to paste. Using this technique, they can integrate well with any program that accepts graphics, including word processors.

(Gigrap Information — <http://www.gigrap.com>; CRE Technologies Corp — <http://www.cre.com.tw>)

### Palmtops

I wandered past Motorola's booth and they had an interesting display of the DragonBall chip. This is basically a 60000 chip, the one used in the original Mac. They scaled down to minimize power consumption. USSR is currently using this chip in its wildly successful PulsePilot handheld organizer. Motorola has put together a tool-kit called PPISM, to allow other vendors to build competing products. There were two Taiwanese companies showing off a variety of Pilot clone products. Note, these products will probably sell substantially lower prices than the USSR unit, and will not be software-compatible with the Pilot, but will probably do many of the same things.

(Adesso, Suntek, First Information Systems — 02-298-2000; [Email: aiss@ais.com.tw](http://www.ais.com.tw); PulsePilot Technology — 04-211-5535; [Email: pulsep@pilot.com.tw](http://www.pulsepilot.com.tw); Matsuk — <http://www.matsuk.com.tw>)

Another hopeful sign for PDA users is the emergence of higher and higher density Flash RAM cards.

I for one was pleased to see 64MB cards, available and 128MB on the way soon, though they are still prohibitively expensive.

### Web TV Boxes

Samco had a box which claimed to run the DIRA operating system. Unfortunately, the company didn't plug the thing in for demos. This highly acclaimed, but slow to market product is a competitor to Microsoft's WebTV.

A unit that show makers could actually try was from Pronto Electronic Industrial Ltd. (886-2-953-5038-9). It seemed a little rough around the edges and there was no web to just type in a URL. You had to return to a home page to do this, rather than having a space always available on screen for this function. The unit is supposed to be available some time this month for less than US\$300 (<http://www.pronto.com.tw>).

### Macintosh Stuff

Not much was on display for real Mac fans. Unix, of course, was there with some new machines, but more emphasis was on a new line-up of high-end graphics PCs. Unisys is making. This company is definitely holding its bats against any foliage in the Mac market.

Taiwan, which also has a license to do Macintoshes, has a similar approach. The company did have a couple of samples of planned CHRP Mac compatibles in its booth, but the people I spoke with seemed unclear on the CHRP strategy, now that Windows NT for the Power PC chip has been scuttled.

(Taitung Computer — (064) 736-2488; <http://www.taitung.com.tw>)

There were a couple of small keyboard vendors offering ergonomic Mac keyboards. This will be a relief to those who have tried the keyboard from Adesso and found it sub-standard.

(Sawag Micro Enterprise — 886 2-276-3366-2; Edary Corp — <http://www.edary.com.tw>)

### Digital Cameras

Long the stronghold of Japanese camera manufacturers, digital cameras are just now starting to show up from Taiwanese companies. I saw units from Matsuk and Unisys. The Unisys Photofax camera was the most unique. It was very small and thin with a projected retail price of US\$8250. The tiny size is achieved by using 2MB compact RAM cards for storage (<http://www.unisys.com>).

# Intranet Knowledge Void Waiting To Be Filled By VARs

By Dan McLean

The next wave of IT is washing over the entire industry and in its wake is appearing a new model of computing that brings users closer to that long awaited concept: ease of use. If you haven't at least heard of intranets, then you've probably been on a different planet for the past year.

Intranets are the newest new model of corporate network computing that takes the user-friendly best of what the Internet has to offer and applies it to the often stodgy corporate environments of business.

For the uninitiated, intranets are networked environments created on corporate LANs and enterprises utilizing Internet-type tools and technologies. Intranets are in

Intranets boast the Web's ease of use. Corporate information can be stored across Web site-type locations so that references to access and communication between corporate users in an intranet boast the simplicity of similar functions done on the Internet. In fact, it's just like surfing the Web.

Best of all, intranets are what the Internet is not — a secure and safe place for conducting business. Corporations can control who has access to what and the type of information which is available. Companies that currently operate some of the largest and most famous corporate intranets, include Digital Equipment Corp., Ford Motor Co., Federal Express, Len Stevens

intranet technology deployment by business will exceed those for Internet technology deployment by a ratio of 4:1 in the next five years. "From Cisco's perspective in Canada, I'm seeing that start to be reflected in the nature of the business we're doing. Not at the 4:1 level," Lloyd said, "but we're seeing very rapid acceleration in the backbone switching adoption rates, the sizes of projects, the amount of security products and firewalls we're selling, and in the focus on scalable bandwidth and network management."

So is there an business opportunity for head-up VARs in this goldmine that is network computing's next wave?

Absolutely.

It's in the area of services rather than products, where the real motherload exists. VARs are a prized commodity among an intranet-hungry business community that is starved for such expertise.

"Any VAR with a combination of skills in this area is well positioned to take advantage of an exploding market," Lloyd said. "I think their ability to grow would be infinite."

"It feels to me like the opportunity that was presented when the PC was first introduced in mainstream fashion back in the 1981 to '82 era. It feels to me — because I was in the VAR community at that time — like the same challenge to IBM the need for expertise in an area that customers simply didn't have at that point in time."

Over in Saginaw, Windows NT Server product manager for Microsoft Canada Inc. in Mississauga, Ont., concurred. "For the resellers that move quickly, there's the opportunity to jump into a market that's expanding very quickly and to establish themselves as a leader within that market."

There are huge opportunities in the service space of provisioning and support for intranets, according to Jeff Voges, business

**"The move towards building intranets is the single largest shift in IT strategies that we believe has occurred in the last 20 years."**

— Rob Lloyd

fact, private networks that incorporate the protocols, processes and standards found on the public Internet and are, among other things, designed to:

- provide the ability to quickly deliver information to corporate users;
- provide users with networking technology that is easy to learn and use;
- offer the ability to support virtually unlimited numbers of users;
- be manageable and controllable; and,
- be inexpensive.

Like the Internet, TCP/IP is the primary protocol of intranets and provides the necessary interoperability base for all types of network operating systems. Browsers serve as the front-end client for accessing corporate information that is, in essence, has the look of a World Wide Web-like environment.

and George Weston Ltd.

While mostly limited to document sharing applications now, many industry experts and analysts are convinced intranets are steering towards a complete revolution in the private network industry and a whole new generation of applications such as network management, and directory and file management.

"In Cisco's opinion, the move towards building intranets is the single largest shift in IT strategies that we believe has occurred in the last 20 years," said Rob Lloyd, general manager of Cisco Systems Canada Ltd. in Toronto. "As a provider of key elements of intranet plumbing and also of intranet security, this is a market that we are interested in accelerating as quickly as possible."

According to Lloyd, studies he has seen indicate the total expenditures on

development manager for Novell Canada Ltd. in Markham, Ont. "There's less and less margin and less profitability in selling the box," he explained. "The business model is shifting more towards services. I hear very often from resellers that, in many cases, they don't really care if they sell the hardware and software. What they prefer to do is get the consulting — help the customer understand their business requirements, then match the appropriate technologies, then implement and manage those technologies."

"That's certainly where the VAR partners can use their expertise and, quite frankly, that's where the money is," he added.

Sagness noted that, during seminars he's conducted across Canada, he's discovered that only between five per cent and 10 per cent of people say they currently use intranets today. However, Sagness quickly added that nearly everyone he speaks to during those seminars say they are evaluating intranets. "The divide between those who are evaluating and those that have implemented is very large, which means there's a huge opportunity out there," he said.

In fact, most users are ready to proceed building corporate intranets right away, according to Vegan. Novell has conducted a series of road shows across Canada since last fall, talking to as many users as they can about intranet technology. Vegan said the level of interest has been impressive and many customers are beyond the point of trying to build a business case and are actually looking to make the move, he said.

"In my personal opinion we're going beyond the point of [companies that ask], 'Do we need an intranet?' The answer is, 'Yes,'" he said.

Currently there is a huge shortage of knowledgeable professionals ready and able to serve a growing demand for intranet skills, according to Lloyd, Sagness and Vegan.

So vendors that provide intranet technology are doing as much as they can to help VARs gain the know-how they need to become the much-needed consultants and implementors. Cisco and Microsoft are among those who are working financially to get their partners up to speed.

The greatest barrier to the deployment of intranets is the availability of relevant technical know-how, Lloyd said, explaining

**"For the resellers that move quickly, there's the opportunity to jump into a market that's expanding very quickly."**

— *Chris Sagness*

that the skill sets for Web-based technology are vastly different from those needed as mini and mainframe computing or traditional database environments.

Cisco offers a number of instrumental opportunities through its VAR education programs — a chance to learn about how to provide the physical infrastructure required to support an intranet model of network traffic. The company is also actively involved in a program designed to encourage postsecondary education to focus on Web-based technologies as part of their instruction, and to ultimately build a stronger base of up-and-coming industry professionals. Cisco recently sponsored a Master of Engineering in Internetworking program at Halifax's DalTech College.

Microsoft provides free Windows NT 4.0 upgrade training for all NT Server 3.x Microsoft Certified Professionals (MCPs). Microsoft pays the \$300 cost of the training while its NT business partner Hewlett-Packard reimburses the \$150 upgrade certification test.

"If you're an existing 3.x MCP and you'd like to upgrade to NT 4.0, we will

reimburse you if you pass the test," Sagness explained. "The reason that this is important from an intranet perspective is because NT 4.0 contains all the basic intranet server features from Microsoft, and most of the (certification) training focuses on the new intranet features in NT Server."

Novell goes a step further through initiatives that Vegan calls "Demand generation." During two road show events since

last fall, Novell representatives have spoken to approximately 16,000 customers, helping them understand what it takes to implement a private corporate intranet, what an intranet is and what it can do for them.

"We can't necessarily count on the reseller — without the support of vendors like Novell — to go out and generate the demand from our customers," Vegan said. "So it is important that Novell help generate the demand and get the customers interested, help them understand why they would want a particular technology and how it will affect their business."

"There have been numerous occasions where a Novell salesperson would go in with the smaller partner to meet with a customer and the first words from the customer were, 'I attended your show, I'm convinced, now tell me what I need!'"

Vegan characterized the intranet space as a huge and untapped opportunity and said there is currently more demand than there is ability to meet it. And it is the upper level of management where the most interested business professionals reside, he said. That means VARs who are looking to sell intranets or business tools should speak to the concept first before talking technical details.

"If the VAR understands how to clearly articulate the benefits (of intranets) to customers then all the technical bits and bytes fall out of that discussion," he said. "What I implore partners to do is not start the discussion with a customer as a technical presentation because what is driving (the deployment of intranets) are business needs. Start with understanding the business requirements and the bits and bytes fall from there."

Don McLean is a Toronto-based journalist who specializes in high technology reporting.

# Motivating Your Employees For Increased Satisfaction And Profit

By Douglas Gray

Do you feel your employees are optimally motivated and productive? Is there a positive energy and synergy in the workplace? Do you hire low employee turnover and high morale? If the answer is yes to all these questions, you probably don't need to read further. Whatever you are doing, you are doing right.

Managing employees is cited as being the biggest problem for small business owners. This is because employers very often don't know how to handle employees. Effectively managing employees is a skill acquired through training and practice. If you are hiring or managing staff, you should spend some time reading and taking courses on this topic. By applying some basic principles of respect and encouragement in the development of each staff member as an important individual, you will reap the rewards of loyal, trustworthy and dependable staff. The following sums up the course on human relations (classic terminology):

- The six most important words: "You don't make a mistake."
- The five most important words: "You did a good job."
- The four most important words: "What is your opinion?"
- The third most important words: "If you please."
- The second most important words: "Thank you."
- The one most important word: "No."
- The least important word: "I."

## Hierarchy Of Needs

Many theorists believe that people have different need levels in their work environment. They progress from one stage to the next, although some people "plateau" or stay at a certain stage for a period of time before advancing on.

The basic or survival level is the starting

point. In order to accept a position, a person needs to be assured that the wages offered are sufficient to meet his/her basic needs for survival (food, shelter).

A person's security needs relate to job, financial, and health security. These are most often addressed by an employer in a benefits package. Examples include training and development, tuition fees for night courses, security systems, wage incentive plans, profit-sharing plans, insurance, pension and medical/dental plans.

Having satisfied the basic and security needs, a person then seeks to satisfy social needs. Having an opportunity to learn new skills, to make suggestions, to interact with other staff, to attend staff meetings, and be called upon for input are examples of how social needs may be met.

The self-esteem needs are satisfied by promotions, praise and recognition, added responsibility, and challenging work. At this final stage the employee is working independently, competently, productively, and has a sense of pride in performing at this level.

A manager's job is to recognize what stage the employee is at, and to assist and encourage them to progress along the ladder to their highest level of capability. Pushing too hard may sometimes discourage and frustrate staff who may have a different learning pace. Effective use of a variety of motivation techniques will foster personal development for the employee, and it can increase productivity and profits.

## Leadership Style

A leader is one who is in control, takes charge of a situation, and is decisive. A good leader or manager is firm, fair, and consistent, as well as flexible. Being flexible doesn't mean that you have to change your personality. You can be firm and still be friendly, you can be decisive and still be polite. You can give someone more freedom without giving away the company. The better you are at knowing how to treat your employees, the more effec-

tive you will be as a manager.

## Motivation Techniques

You can reduce unwanted employee turnover and the high cost of recruiting, hiring, and training new staff by shifting these costs to keeping and developing experienced ones. For example, you can motivate an employee to increase productivity by providing opportunities for career development. At the same time you have improved the worker's skills and shown recognition of the worker's value and aspirations. Also delegation becomes a motivation technique when an employee is assigned challenging tasks, and given the authority to see it through completion. Shared decision-making is a good management practice, whereby employees and management suggest ways to solve a problem, and a consensus decision is made by the group on which action to take.

## Incentives

There are numerous incentives which an employer may use to satisfy a person's security needs. Perhaps the most obvious incentive for employees is a pay increase.

While it is difficult to relate fringe benefits to employee productivity and job satisfaction, an attractive benefit package will contribute to the image that your organization is a good place to work. This image will attract prospective employees, reduce employee turnover and favourably influence suppliers and customers.

# Capitalizing On Co-op

*Is your company taking full advantage of the marketing funds and programs that are available to you?*

By David Rosen

Co-operative advertising funds? At first glance it seems an exceptionally good deal: "You mean they'll pay me to advertise?"

Well, sort of. Introduced over a decade ago, co-operative advertising funds were originally designed to improve sales, establish brand recognition and create interest in the marketplace. These funds are usually offered by large manufacturers to resellers who must use the money toward advertising of the manufacturers' products. Sounds good, right? But just as quickly as they were discovered by manufacturers' resellers, they were discontinued because of all the limitations and preordained hoop-jumping required by the manufacturers. Apart from the occasional advertising agent or local *Yellow Pages* directory, many resellers found that obtaining the money from their funds simply wasn't worth the trouble of dealing with manufacturer's red tape and the convoluted claim forms. Besides the fact that you usually had to spend money to use the no-co-op funds made these programs even less popular.

A lot has changed over the past decade. Many manufacturers have listened to resellers, reworking their co-op programs to be more friendly and flexible.

Manufacturers' co-op programs as a competitive advantage in fact, some

declined to be interviewed for this article, among they didn't want to give away competitive information.

John Thiele, Hewlett-Packard (Canada) Ltd.'s marketing manager for its commercial business organization, explains the company's co-operative marketing has changed to reflect the market. "HP's co-op program is designed to reward and incent specific reseller performance," he says, adding that "it has moved away from the fixed percentage co-op model to one that adds long-term value — both for the reseller and Hewlett-Packard."

HP's marketing and technical support, including the company's *InSight* newsletter, dedicated reseller Web sites, lead generation and training all cost money and are created as part of HP's co-operative programs. Thiele says that HP's top resellers have their own individual company rep whose pay, in part, comes from and as a result of the reseller's activation.

But co-op wouldn't be co-op unless there was a system of direct financial benefit

to reseller. The company's market development dollars are parcelled out through its distributors in a flexible program. For example, minimum quarterly sales of \$100,000 generate 0.5 per cent into the reseller's account, and this percentage can grow to 0.75 per cent, depending on sales. And Thiele adds, understanding the program can only work to the resellers' benefit.

With 10 per cent of the global market, Compaq is the world's leading PC maker. John Chaillet, Compaq Canada's corporate and public relations manager, says the company's Market Development Fund (MDF) is one of the reasons behind this success.

"Every reseller has an MDF account that they can draw from to support their own activities," says Chaillet. "Different resellers use the MDF in different ways, but usually it's for co-op advertising, staff training and relationship-building activities." Compaq's program covers things such as *Yellow Pages* advertising, business programs such as speaker of the business development activities and other pre-approved activities. But just because an activity isn't on the pre-approved list, doesn't mean that Compaq won't fund it. "We'd listen to just about any idea that will make business sense," Chaillet adds.

Even IBM, legendary for paperwork, is wanting to see the light and making its programs less burdensome. IBM's Focus Program is a series of marketing components available for resellers based on soft dollar records. "The more a reseller sells, the more soft dollars there are in their account," explains Susan Taylor, spokesperson for IBM Canada Ltd. But despite the flexibility of the Focus Program, Taylor claims the paperwork is minimal. "It's just a one-page form that needs to be completed."

Pay attention to your co-op opportunities. It may deliver long-term benefits to your bottom line. DR

## Get Co-op Working For You

Although manufacturers have each designed different co-op systems, the goal of all programs is the same: to focus the reseller on their products and solutions.

### Get the fine print.

Manufacturers want resellers to use the dollars they have, but they say many resellers does not because they don't even try to understand the programs.

### Keep a tickler file of rollout dates.

Most co-op funds are time-sensitive, meaning that if money in the funds is not used by a certain date it rolls out of the account — forever.

### Support on-going activities.

Co-op dollars be used for one-time efforts as well as for reducing expenses relating to on-going efforts such as staff training or even business trips.

### Keep current with the programs.

Ask around every so often as you don't miss anything important.

### Get creative!

All the manufacturers interviewed for this article suggest that resellers to come up with some interesting ways to spend their co-op dollars. After all, it's your money.

John Thiele, HP reseller and marketing performance

# Bolster Your High-Tech Image

# VARs:

Value-added resellers who are looking to get out the message about your company's particular products and services should be aware of some key marketing differentiators to this industry.

By David Eisenstadt

The fundamentals of marketing communications are much the same for high-technology companies as they are for any other business enterprise.

But there are several special situations, where you have a bigger edge or a greater need than providers of more traditional products and services. You just have to know how to take advantage of your uniqueness. Here are 10 generalities about high-technology business operations that should be considered in your marketing communications strategy. Most of them will apply to your company to a greater or lesser extent.

### You're the right kind of people.

High-tech firms are among the most desirable corporate citizens: non-polluting, generally quiet operations, employers of highly skilled people (at accordingly higher wages), offering the promise of spectacular growth potential. The public is generally better disposed to give you a positive first hearing than, say, an environmentally noisy, accomplished firm or the assembler that is notorious for low wages.

### Product differentiation can be made more dramatic.

Promised you can explain clearly and without confusing jargon how your product or service can make a real difference to your customers, you'll have a legitimate claim to use words like new, inventing, a apart in something that gets the job done better than it could have been done without you.

You need to get that uncluttered message across anyway — no matter how technically literate your immediate prospects may be, few high-tech vendors can make a sale without convincing the non-technical decision-makers who want to know how you can improve the bottom line.

### Your target publics are generally easy to identify.

Most consumer products' manufacturers devote considerable marketing effort to identifying the right market positioning. High-tech companies generally sell very specific solutions to very specific problems. While others struggle to sell the issue, you can concentrate to a much greater degree on selling the *weak* — and you know just who the likely prospects are.

### The public is hungry for high-tech market intelligence.

You'll find a much more receptive public audience when you promote your reseller firm if you supply them with intelligent generic information on how fast the robotics industry is growing. A similar market positioning is possible for almost any high-tech message: you can sell your solution better if you show the dimensions of the problem. Help

powerful customers them understand what's going on in database management, for example, and you'll be more credible as an advocate with your own database project.

### You can humanize your technical know-how.

High-tech innovators are often young, aggressive and brilliant — just the people the news media likes to see as heroes of tomorrow. A knowledgeable communicator should be able to identify human interest angles in the struggle you and your company have had to get to the forefront of a very tough market-place.

### Public perceptions can be critical to potential investors.

Where many traditional industries can point to fixed assets and retained earnings to attract investors, high-tech firms often have very little in place and equipment to point to. Lenders, corporate buyers and investors like to see recognition within your industry that you're intellectually equipped to survive the pace of technological change and industry shake-outs.

### You have to draw your resources from a very small talent pool.

Virtually every high-tech business faces a never-ending struggle to attract staff with skills critical to its continued operation. A higher public profile will go a long way to convincing the people you need that your company is where today's action is. That's often the deciding factor, ahead of salary and benefits packages that are generous enough everywhere.

### Your customers want continuing relationships.

Buyers of high technology generally want to keep ahead of advances in their field. Today's big contract can mean nothing when your customers look for the next upgrade, unless you position yourself as a technology partner they can grow with. That means continuing to reach them, even after they've signed the order. They'll be interested in product enhancements before they finish installing the original order.

### It's easier to keep abreast of the competition.

High-tech firms are necessarily competitive, and the rules of the game can change overnight. Your customers will be well aware of the virides your competitors are marketing, and there generally are not very many of them. You should take advantage of these opportunities when you develop your own marketing communications program. **BB**

# Are You Fully Servicing Your SOHO Customers?

by Darren Khetr

Advances in technology have provided cost-effective solutions for people to run businesses from their home or small office environments. Helping the SOHO user effectively sustain their business is an opportunity resellers need to act upon.

To maximize this opportunity, resellers need to stay educated on technological advancements and understand how to incorporate them into the SOHO user's business solution. The distribution channel, in turn, must provide services and education to meet these reseller needs.

## What Really is SOHO?

In simple terms, the SOHO market consists of small independent businesses with less than 25 employees. Some are stand-alone with little or low MIS resources, and some are branch offices which have larger support resources.

Let's focus on SOHO customers who don't have access to a corporate information systems group to look after their operational needs. These SOHO users are looking for a "solution-in-a-box" which can provide sharing of resources including phone, fax, printer, CD-ROM

and Internet access. These types of solutions provide the basic services that an average small office or home office would require.

However, for certain SOHO users, the basic services are not enough to expand their business. They therefore need the expertise and education of the reseller to help them grow.

## The Competitive Drive

To remain competitive, SOHO users must provide the same level of market presence as their large corporate counterparts. One way at which they can accomplish this is by taking advantage of electronic commerce tools through the Internet. These tools will provide more information to a reaching either a broader audience, or targeting a specific group of people more efficiently. Used in conjunction with a Web site, these tools can also give your customers the same global appearance as their larger counterparts. Several companies have developed new applications to allow SOHO users to create Web pages and database linkage through simple edit, paste, and fill-in-the-blank forms.

Days of new and faster technology and its accompanying applications have driven the need for additional bandwidth, security and flexibility. These changes have taken place both in the enterprise networks, as well as the SOHO user environment. Today's requirements demand that the networks provide the user with interactive network-attached information access. Also, the increased use of multimedia within application areas means that some users can no longer connect through a mere 28.8Kbps modem.

## Networking Realities

There are several vendors that have picked up the slack in this area, including telecom providers, or most recently the cable television providers. However, SOHO users possibly keep up with these technical requirements when they are more focused on running their business.

This is the opportunity for the reseller. Resellers must possess a greater understanding of the wide area communication network, which includes anything from the simplest basic hardware to the vertical market application. Although the SOHO user can employ the use of a small LAN, the fact is that the connected SOHO workstation is a node on the Internet—the network of all networks. Emerging technologies like X.25, ISDN, ADSL, cable modems, and various wireless technologies have developed to meet these needs. Resellers need to respond to these changes with the ability to provide consulting services in order to maximize the SOHO user's environment.

## The Distributor's Role

Distribution needs to provide the reseller community with the additional marketing and technology services to benefit from this growing market. Distributors need to facilitate the reseller's ability to design, implement and market solutions, via education programs. **OF**

# The unbeatable value-packed Pine Multimedia PC

Strong is believing! With quality components from the biggest names in the business, you can look no further.

Pine Multimedia PC with MMX™ Technology now offer you unbeatable performance at unbeatable prices. All Pine Multimedia PC systems now come with 3D sound and eventable technology as a standard feature. What's more, you can also expect equally reliable service and support from **Samtack**.

**Now your choice is only natural!**

## Come celebrate with us!!

In conjunction with our 5th ANNIVERSARY, we bring you everyday great deals, special & relates from all these great names: **Fujitsu, Quantarax & NEC** hard drives, **Mitsumi** multimedia and peripherals, **Goldstar**, **ZTUM** & **Imago** monitors, **Cannon & Lennmark** printers, **Imadonics** by **US Robotics**, **network products** by **Aeropen**, **graphics cards** by **Pine, Matrox & ATI** and more...

Come join in the celebration and maximize your profits with **Samtack**.

We welcome reseller inquiries.

- 48 hours PC systems order turnaround time
- 48 hours replacement policy on most products
- Same day pick-up & delivery service
- Dedicated account executive for each customer

# Building A Web Site For Business

welcome > computers > motherboards > modems > monitors > etc.

By Sean Carruthers

Whether you're finally getting your business on the 'Net, revamping your Web site, or helping a customer build an on-line presence — You want to make a splash. Right?

Should you get out those way-cool backgrounds you've been saving up? Or fire up those up the nifty features in your Web site-building programs? Animated gifs? Frames? Java? Shockwave? You want it all — this should be the coolest site on the Web, Right?

Anymore, a better aim would be to have the most unimpeachably use on the Web. Too often, in the rush to put in the bells and whistles, site-builders make their pages frustrating to navigate, sometimes nearly incomprehensible, and painstakingly slow. Stress the substance of your site, as opposed to the style.

First, figure out what you want to appear on the site. Should it serve as a basic on-line information source, and instruct customers on how to contact you for more information? Will there be an on-line list of the items you carry? Will you offer newsletters and other "fun" things to bring people to the page?

The information you plan to provide is the basic foundation of the page. But how you present that information is crucial. Two key areas to avoid are trying to put everything onto the first page [at all places, Netscape <http://www.angelfire.com>] used to be very bad for that], and burying information so far down a chain of links that it becomes nearly impossible to find. Note: Microsoft <http://www.microsoft.com> is still a culprit, in its download section, making visitors jump through a seemingly endless line of unconvincing loops before reaching the links to the download sites.

Organize the pages so nearly everything is within three or four clicks of the main page, without crowding so much information in any one area that it becomes unwieldy.

Smoothness of navigation is truly important. If the site is easy to get around and intuitive, it is easier for customers to find information they will need to make purchases. Otherwise, they may get so frustrated that

they'll go elsewhere.

## Presentation

Now that you know what you want to appear on the site, and where, you may be tempted to jazz things up a little bit: a wild background here, a groovy text color there, and a bunch of animated pictures chugging away at the corners of the page.

Too many people, drunk on the power of being able to design their own Web sites, create monstrosities that look good if taken as modern art, but which are almost impossible to read. Backgrounds might overwhelm the text on top of them, or the text color might be clashing with the background or disappearing into it. Keep in mind, when designing your pages for aesthetics, that the color scheme may look glorious on your souped-up system with billions of colors, but when that same page is displayed down to 256 colors, it may very well become a mottled mess. And as many what anyone says, bright green text will never look all that good on a bright red background. If you're determined to use a background, the subtler the better. The point is to get information across, and there should be as little interference from non-essential parts of the page as possible.

Frames are the latest trend. Beware, although there are some places where frames can be truly beneficial, badly done frames can mess things up in a hurry. The two most common problems are mis-sized frames (remember the Web is a dynamic medium; not everyone's screen size is the same!) and the Death Spiral [frames within frames within frames within ...]. If it's possible to accomplish the same thing without the frame set-up (say, a navigation bar), and the only reason for the use of the frame is its "coolness," simplicity should prevail.

Animated gifs can be good at attracting attention in certain parts of the page, but know when to stop! If the page gets too busy, your critical data will get lost or ignored, as the potential customer is transfixed by all the

whirling and blinking lights — much like a deer caught in headlights.

## Bandwidth

Keep in mind that not everyone who will be viewing the page has a computer right on the backbone of the Internet. You will quickly learn that success can be a virtue.

Graphics can still be used effectively on a low-bandwidth connection if kept reasonably small and compressed. Tweak the picture quality where possible. Jpg can often be shrunk to about half of its previous size with only minimal loss in picture quality.

On a graphics-intensive page, provide an alternate label for each of the graphics, so that people with low bandwidth connections know what's in a picture box without having to wait for all of the graphics on the page to download.

It takes five minutes for each of your pages to completely come up on your visitor's screen, and if all of the graphics on the page have to be loaded up for things to make any sense — a lot of customers who are too frustrated to wait for the good stuff, or the information they need, may be lost.

## Start Small

Provide the essential information first, such as how to contact your business (provide both electronic means and traditional means). As you have time, add the more specific details (product reviews and interesting links, for example). Trying to plow out a complete site, all at once, can quickly prove overwhelming, and parts of the site are bound to suffer.

What's important in the end, is the information you're trying to get across to your potential customer. If you can get it to them as easily as possible, you're more likely to get the sale.

# Why Are We Still Waiting?!

DVD, Universal Serial Bus, Cardbus, FireWire, Plug and Play — why are these taking so long to ready catch on?

by Alan Zisman

A classic 1980s soul tune by Curtis Mayfield was entitled "A Change is Gonna Come" and perhaps it should be our theme song these days.

A slew of new technologies were promised for PCs for 1997 — including DVD drives, Universal Serial Bus, and MMX processors.

Some of these technologies have actually arrived, either as a stand or a module. MMX processors, for example, have pretty much replaced earlier models. As predicted, SDRAM memory is being replaced with faster SERRAM.

But where, for example, is USB — Universal Serial Bus?

The computer I purchased last winter has pins on the motherboard to attach a USB adapter, but it hasn't done that — in fact, I'm not sure where I could purchase the parts. Why bother? There aren't any ready available devices to plug into it. And yet, USB devices were seemingly everywhere at the 1996 Comdex/Fall show.

Consumers, vendors, wholesalers, and manufacturers are all stuck in a classic "chicken-and-egg" syndrome. Vendors cite a perceived lack of consumer demand, while consumers are often unaware of promised products that aren't yet on the shelf. Of course, it doesn't always work that way. When Intel's widely-hyped MMX processors didn't make it in time for Christmas purchases last winter, many consumers chose to wait, and there was a big jump in sales of home PCs early in the new year. At the heart of the problem, however, is the lack of operating system support. When so-called Class Drivers are built into the operating system, as with printers and modems, it's simple for hardware manufacturers to provide support for new models and new technologies. When those are missing, however, each new model requires a new driver, created from the ground up.

So, even though it was announced back in 1995, wide-spread support for USB may have to wait for next year, if not longer. The higher-performance FireWire bus may take awhile before it becomes a common feature. Device makers only began to receive long-promised support code from Microsoft in April.

Let's look at the status of some of the promised new technologies.

Plug and Play was promised in 1994 by Intel. It is now supported by most motherboards and BIOSes, and by Windows 95, but not in the current version of NT. For too many users too much of the time, it remains more like "Plug and Pray." New specifications being promoted by Microsoft and Intel as PC98 will encourage manufacturers to drop support for the 1984-era ISA bus. Until that happens, and device manufacturers fully support it, reliable Plug and Play will remain more vision than reality.

USB, as we've seen, may have to wait until it is fully supported by Microsoft in its next generation of operating systems, NT 5.0 and the next version of Windows 95, currently code-named Memphis.

FireWire has been slowed down by a desire to push the lower-cost USB, and by the lack of easy preliminary code from Microsoft. Apple has announced support in future Macs.

Cardbus has been promised as a high-end replacement for PC-Cards for notebooks. It too has been slow to catch on, though it's avail-

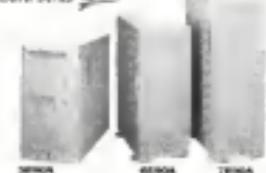

able on a few high-end models. In part it's been delayed because there hasn't been much perceived need. Its big advantage has been to provide support for Fast Ethernet networking, which is not yet a mass-market item. As well, it's been hampered by a lack of general operating system support, as was the original PC-Card specification, prior to Windows 95.

Until the next generation of operating system releases offers full support for the crop of hardware advances proposed back in 1995 and 1996, there will be only minimal support from device manufacturers or computer makers. As Curtis Mayfield wrote, these things are "a long time coming. But I know, a change is gonna come." Next month, the continuing saga of faster CPUs. ☐

# Evolutionary Theory: The Return Of The Threes And Fives

by Greene Bennett

There's an old saying that good things come in threes. Let's expand on that axiom and say that the third and fifth versions of nearly any product will prove to be the best.

There's plenty of evidence that this is true. For one thing, really bad products usually don't make it to a third revision, so if a sort of market-driven evolution, only the strong survive. And it's widely held among consumers — especially computer hardware and software users — that version 1.0 of anything is full of holes and unfinished promises — the original Apple Newton, for example, or Windows 1.0. Of course, the Web era has ushered in the increasingly commonplace concept of "public beta" releases that thumb nicely like the piece of the 1.0 releases of yesterday, but even "beta" is now a sort of fossil on by marketing masters who prefer to term their incomplete and not-ready-for-prime-time products as "Platform Previews" or Preview Releases. At any rate, 1.0 versions get bought by the pioneers who apparently like those arrows in their backs: inadequate support and all the other glitches that come as part of the package. Sooner or later the second version follows, addressing the truly grievous problems of the initial release and adding "iron horse" features. If all goes well, the reviewers (notorious optimists that we are) give it the thumbs-up and the mass media starts to take notice.

Now we have a product with legs, and it crowds out the competition. By the time it gets to Version 3, it has usually evolved into a version that is not yet widely blamed — nor truly rechristened — product.

Those products that do make it past the third version, unfortunately, often succumb to factors — if the past is any indication.

Look at the evidence.

Who used MS-DOS 1.0? Version 2.11

through 3.3 were the versions that most "early adapters" got used to, and it was Version 5 that really represented a mature product. Version 4 of MS-DOS represented a classic missing-link-quality performance and feature blurb. Version 3, for the most part, set things right.

CorelDraw is another good example. Version 3 was the first really good one. It remained on the market for many years (even after Versions 4 and Version 5 were available).

**"Arguably, WordPerfect 5.1 was that company's definitive 'sophisticated' product — especially if you count profitability and market-share."**

Version 4 was, in most users' estimation, an overly large box of problems and Version 5 represented a highly usable version that, even today, many shops stick with as their choice (we happen to like CorelDraw 7, though). The fact that each version of CorelDraw usually takes about five "fixes" to get to a reasonably reliable state is an auxiliary issue we won't explore here.

Windows, of course, is the classic example. Version 1.0 (I in particular) was the first time it all clicked, and Version 5 — which, by our counting, is Windows 95 OSR2 — is another solid release. Like many products that make it past their fifth generation, Microsoft's challenge is to add value to the sixth and subsequent versions of its products that make them a compelling buy. As we saw with DOS, after you've bundled a bunch of extras with Version 6.0, there's not much left to do.

It's not too much of a gamble to predict that Windows NT will follow this megapattern, as version 3 is — the first version to gain wide acceptance — finally reaches what we think will be its final true fruition with Version 5.0 — plus service pack, whatever.

Arguably, WordPerfect 5.1 was that company's definitive "sophisticated" product — especially if you count profitability and market share. Microsoft Word version 6.0 for

the Mac was a classic example of a 6.0 release that failed to capture the imagination and dollars of users as the previous 5.1 release had done.

Now, with WordPerfect 8.0, Word 97, and all the other "post-Web" word processors on the market, perhaps we'll have to come up with a theory for eights and nines.

It is amazing — even when it doesn't always work — to think of the ways that

other technologies evolve in this way. Storage devices, printers, modems, Web browsers, CPUs (where, amazingly, you can swap almost any model and see that it technologically peaks out after three and is discontinued or reincarnated after six revisions) — even the careers of famous people often pan out this way.

Look, for example, at the greatest careers and breakups of the Beatles. The Who, or just about any artist who self-devoted. The third period is one of artistic maturation, followed by a dark period of difficulty followed by a triumphant masterpiece — and then more often than not, the system collapses.

In cases like these, it is best to generalize the third, fourth and fifth periods as "gold in age," "dark ages" and "glory days" and so on. Using this conceptual framework, we can map the pattern to everything from Arnold or Apple Computer to western civilization, in general. While you are wise to be skeptical of any system that seeks to simplify that which is massively complex, if we take the broad view — such mega-patterns do exist. ■

## Interlink Electronics offers touch input

Two ergonomically designed input devices have been announced by Interlink Electronics. The VersaPoint Wireless Keyboard and the VersaPad are designed to make the operation of computers easier, more convenient and healthier by making the tasks of entering text, choosing menu items and moving a cursor more natural.

The VersaPoint Wireless Keyboard is an 81-key keyboard with an integrated touchpad. The keyboard is ideal for effortless Internet browsing, flexible text entry and business presentation

control. It uses four AA batteries with an average battery life of one year.

The VersaPad offers an upward evolution from earlier touch sensitive surfaces, as it enables "precise cursor control via a fingertip or stylus, one-touch pan and scroll capability, a customizable toolbar, and on-the-fly signature and graphics capture".

The VersaPad requires only five to 10 grams of pressure, to allow effortless cursor control, either from a bare or gloved hand or a stylus.

For more information on the products, contact <http://www.interlinkelec.com> or call (805) 484-8855.

## Dolch Computer announces mobile products

June 2 saw the launch of products from Dolch Computer Systems, such as PAC MediaMaster, a portable PC based on the Intel 266MHz MMX Pentium II, the 33 MHz G3 VEGA PCI video controller, and the Creative Labs Vibe 16X audio engine. The PAC MediaMaster is the latest implementation of Dolch's PAC (Portable Add-In Computer) technology, a cleverly designed and robust "choose-in-chassis" architecture that allows Dolch computers to service very hostile environments. From the battlefield to the boardroom. The PAC MediaMaster can be configured with up to 972MB of EDO RAM, up to 9GB of SCSI hard drive and a 16X CD ROM drive. The MediaMaster is a "tagable" computer not a notebook, but in exchange for its heavy weight, it offers six PCMSA internal expansion slots.

Visit <http://www.dolch.com> or telephone (510) 661-2229.

## Imation launches the Tape-It software

Imation Canada Inc., a subsidiary of the 3M spin-off Imation Corp., has launched Tape-It Software for use with its Travan microbridge drives, which offer backup and restore under Windows 3.1 and Windows 95.

According to the company, by assigning a drive letter to tape devices on a user's Windows system, the software allows users to create a back up by dragging and dropping files. Tape-It says users save and access data on tape cartridges, as they would on floppy or hard drives.

For more information, visit <http://www.imation.ca> or call 1-888-466-3456. **ED**

## Chili!Soft targets servers

On June 2, Chili!Soft, a Pennsylvania-based server software developer, introduced Chili!ASP (Active Server Pages) for Web servers. Chili!Soft claims that Chili!ASP is the only software that can run Active Server applications on non-Microsoft Web servers.

Microsoft had pioneered the Active Server Pages technology to facilitate internet application development, and Chili!Soft has now made ASP technology available to other Web server software platforms. Software developers can use common development tools such as VB Script and J Script to build scalable internet applications. The new Chili!ASP could be an important tool for making software applications readily accessible over the Web.

According to Charles Cristof, CEO of Chili!Soft, "Developers can literally copy their existing ASP apps over to Chili!Soft and then run the application".

For more information, check out <http://www.versus.com/chilisoft> or phone (847) 291-1616.

## CALENDAR

**Novell's Marengi resigns**

Novell Inc. has announced the resignation of Joseph Marengi, president and chief operating officer.

Marengi served as president since September 1990. While the company conducted a search for a new chairman and chief executive officer, says Novell, he had joined Novell in 1989, and has held such responsibilities as executive vice-president worldwide sales, and chairman of management and sales executive positions.

Novell recently announced it is "realigning" its business model to bring it in line with the realities of the market-place. The company says its current strategy is to become the leading Internet/intranet software provider.

Eric Schmidt, Novell chairman and chief executive officer, will temporarily assume the responsibilities of president.

**Sue Miller is new president at Compaq Canada**

Sue Miller

In her new role, Miller is responsible for the overall operational activities of Compaq in Canada, including sales, marketing, systems engineering, field support, distribution, finance, administration, customer satisfaction and quality.

She has more than 15 years of management experience in the computer industry, including positions as president and managing director, Mervel Europe and senior vice-president, Mervel Inc. president, Tellgian Technologies Canada Inc. and general manager and controller, Digital Computer Inc.

Now returning to Miller are Judy Boyle, manager, human resources, John Boyle, director, marketing, Ray Hulme, director, channel sales and development, Gary Reid, director, customer services and training, Claude Sylvain, manager, information management, John Shuster, director, operations, Pat Ward, director, national sales, and Debbie Young, director, finance.

**Epson appoints sales director**

Willowdale, Ont.-based Epson Canada Ltd. has appointed Jim Masada as director, sales marketing. He joined Epson Canada eight years ago and has helped to develop and implement both OEM and branded sales strategies for Canada, says the company.

Masada was most recently national sales manager. In his new role, is responsible for directing Epson Canada's overall sales and marketing programs.

Paul Grand

**Seamix president wins award**

Seamix Technology Ltd.'s president and founder Paul Grand, recently won the *Financial Post's* **40 Under 40 Award**, given to 40 outstanding Canadian under 40 years of age who "have achieved excellence in the field of arts, business or community service."

Seamix claims 1996 annual sales of just under \$100 million. The firm's main factory in Richmond, B.C. has a monthly production capacity of more than 10,000 PCs and 50,000 board-level products.

**Targus appoints manager of OEM accounts**

Targus Canada Ltd. of Mississauga, Ont., has appointed John Steward to the position of OEM account manager. He is creating new lines of customized carrying cases for notebook computers, digital cameras, portable printers, handheld PCs and overhead projectors.

Steward has had a career focused on carrying cases and the luggage industry. In his new role, he will expand Targus Canada's current OEM business and develop new opportunities, says the company.

**Borland appoints executives**

Borland International Inc. has appointed Kathleen Fisher, to chief financial officer. She brings more than 15 years of experience to the position, including years as the former financial executive of AST Research Inc. and Western Digital Corp.

Fisher succeeds Paul W. Ensay, who has left the company.

Borland has also appointed Richard LaFerche, to chief technology officer.

LaFerche has more than 20 years experience in technology research and management at companies such as Victron Inc., Silicon Graphics Inc., Sun Microsystems Inc., Tektronix Inc., and most recently, Apple Computer Inc., where he was vice-president of Apple's Advanced Technology Group.

# Computex Spotlights Taiwan's Industry Influence

by Douglas Alder

I recently traveled to Taipei, Taiwan — certainly one of the most influential shows for the computer dealer channel.

Though it lacks significant quantities of major resources, the tiny island of Taiwan (which is smaller than Vancouver Island), located about 100 km off the coast of the People's Republic of China, hosts 21.5 million people, and is one of the world's largest manufacturers of computer products. The country leads the world in motherboard production, and produces a third of the world's notebooks. Significant proportions of the world's supply of cases, power supplies, keyboards, monitors and controllers other computer products come from Taiwan.

The show is held every year at the beginning of June, which also corresponds with the summer monsoon season. I arrived more days than I was there. Crack the heat up to 30 degrees Celsius and the humidity to high and you have a pretty good idea of what it's like in Taiwan.

## Innovalue

The marketing people for Taiwan have coined the term *innovalue* to describe the island's approach to creating products for the world markets. It's a combination of innovation and value. Another word combo they should consider is *clustering* — a combination of cloning and diverging. Many Taiwanese companies will take an existing product and rapidly come up with a high-quality, lower-cost alternative with some new wrinkles to the product.

I saw numerous examples of this. The Papercon scanner, Polar handheld computers, motherboard and Wincom adapters were all up for the kind of treatment.

The show had very little software on display. Out of more than 600 booths, there were as few as 28 featuring on software. One

vendor suggested that because software piracy is so rampant in many countries along the Pacific Rim, that Taiwan businesses do not trust putting their efforts into a medium that is so easily pirated.

The Computers show is very much a show from Taiwan manufacturers to the world. Most of the vendors are from Taiwan, though some Japanese, American and European companies show up to try and build support for their technologies with the huge, dominant Taiwanese motherboard manufacturers.

## Major Trends

The show was good, though lacking in somewhat lacking in truly innovative products. Taiwan's strength has been to focus on specific product categories, build expertise and then dominate the market. I saw endless variants of scanners, motherboards, notebooks, tiny monitors, Web TV devices and keyboards.

## Canadians Abroad

One Canadian I did run into was Doug Stapleton, formerly of Samsonic. He has started up his own company to act as agent for Jean Monet Inc. Jean Monet is, according to Stapleton, one of the largest producers of monitors in Taiwan. They do a lot of D4M work and have so far avoided the temptation of building a brand name. Stapleton says the company is setting up with a silk-screen in Canada so that smaller orders (300 to 500 type volume) can be processed right in Canada.

## Newton Saves The Week

My Newton saved my butt on this trip. The trip from Vancouver to Taiwan is a 10 to 11-hour trip. My notebook usually gives up the ghost about half way through the Toronto-Vancouver flight, so I did not expect it to make it all the way across the Pacific. With that in mind, I brought along my Newton

2000. The Newton will last 20 to 30 hours on four AA batteries. I was able to get a fair bit of work done with it. When I arrived at the hotel, I found that the screen on my notebook had gone bad and all I had was my Newton to rely on.

## International Dial-Up Service

I recently signed up for the IBM Net. It is one of the most comprehensive log-in networks on a worldwide basis. I checked and they seem to have offered dial-up numbers in more countries than CompuServe or any of the smaller ISP startups. One good thing about IBM Net seems to be that the company doesn't propagate it very well, and as a result the lines are not always busy. In fact, I only had one busy signal in about 20 dial-ups.

If you are planning extensive overseas trips, IBM Net is definitely worth a look.

Warning: accessing any Internet sites with the extension .tw may be a little slow, because the pipes to Taiwan are currently not big. The country is making an effort to upgrade them, but their telephone company runs a monopoly so it may take a while.

## What's In A Name?

Taiwan has some big companies, but their names don't jump off your lips like major Japanese or Korean companies. Taitung, Mitac, Acer, Unixx and First International Computer are some of the biggest. There are a number of Taiwanese technology companies that make up for their size deficit by chiseling very unique names.

Some of the most interesting ones I saw at the show included Strong Man Enterprises, Song Chien, Groovy Peripherals, Art Atticwise Computer, Well Rest Hardware, and best of all, Handsome Strategic International.

# Face The Future

## The First, The Best, The Only

multimedia LCD monitor is ready to blow your CRT monitor off the desk! Sceptre's FT15 15" LCD monitor (14.5" viewable) is flicker and distortion free, gives off negligible amounts of electrical emissions and zero magnetic radiation. Compared with a standard 17" CRT monitor, (yes, 17") the plug and play FT15 uses just one quarter the desktop real estate.

The FT15 is Sceptre's fourth generation flat panel LCD monitor. With that history of engineering excellence, plus the fact that Sceptre is an ISO 9001 manufacturer, you know that you are getting nothing but the best.

Period.

Call now to find out how to blast your viewing experience into the future.
